As highlighted, understanding whether treatment involving this common psychotropic agent is necessary for patients with bipolar depression and comorbid substance abuse requires research focusing on this subgroup. The study of an NMDA receptor antagonist, ketamine, has shown that this substance is effective for the treatment of depression in healthy, non-psychiatric patients, and in patients with bipolar depression. However, safety and neurobiological mechanisms of action require further study to determine that these mechanisms are not shared. It is important to the research that this approach be studied in combination with ongoing psychopharmacologic treatment. It is important that this study determine if the NMDA receptor antagonist is effective in combination with ongoing treatment.
