High-Performance Computing on the Intel® Xeon Phi™ Endong Wang, Qing Zhang, Bo Shen, Guangyong Zhang, Xiaowei Lu, Qing Wu, Yajuan Wang, 2014-06-26 The aim of this book is to explain to high performance computing HPC developers how to utilize the Intel Xeon Phi™ series products efficiently. To that end it introduces some computing grammar programming technology and optimization methods for using many integrated core MIC platforms and also offers tips and tricks for actual use based on the authors first hand optimization experience. The material is organized in three sections. The first section Basics of MIC introduces the fundamentals of MIC architecture and programming including the specific Intel MIC programming environment. Next the section on Performance Optimization explains general MIC optimization techniques which are then illustrated step by step using the classical parallel programming example of matrix multiplication. Finally Project development presents a set of practical and experience driven methods for using parallel computing in application projects including how to determine if a serial or parallel CPU program is suitable for MIC and how to transplant a program onto MIC. This book appeals to two main audiences. First software developers for HPC applications it will enable them to fully exploit the MIC architecture and thus achieve the extreme performance usually required in biological genetics medical imaging aerospace meteorology and other areas of HPC. Second students and researchers engaged in parallel and high performance computing it will guide them on how to push the limits of system performance for HPC applications.

GPU Parallel Program Development Using CUDA Tolga Soyata, 2018-01-19 GPU Parallel Program Development using CUDA teaches GPU programming by showing the differences among different families of GPUs. This approach prepares the reader for the next generation and future generations of GPUs. The book emphasizes concepts that will remain relevant for a long time rather than concepts that are platform specific. At the same time, the book also provides platform dependent explanations that are as valuable as generalized GPU concepts. The book consists of three separate parts: it starts by explaining parallelism using CPU multi-threading in Part I. A few simple programs are used to demonstrate the concept of dividing a large task into multiple parallel sub-tasks and mapping them to CPU threads. Multiple ways of parallelizing the same task are analyzed and their pros and cons are studied in terms of both core and memory operation. Part II of the book introduces GPU massive parallelism. The same programs are parallelized on multiple Nvidia GPU platforms and the same performance analysis is repeated. Because the core and memory structures of CPUs and GPUs are different, the results differ in interesting ways. The end goal is to make programmers aware of all the good ideas as well as the bad ideas so readers can apply the good ideas and avoid the bad ideas in their own programs. Part III of the book provides pointers for readers who want to expand their horizons. It provides a brief introduction to popular CUDA libraries such as cuBLAS, cuFFT, NPP, and Thrust; the OpenCL programming language; an overview of GPU programming using other programming languages and API libraries such as Python, OpenCV, OpenGL, and Apple's Swift and Metal; and the deep learning library cuDNN.
