Parasite Infections: From Experimental Models to Natural Systems Toni Aebischer, Kai Matuschewski, Susanne Hartmann, 2018-07-06 Eukaryotic parasites including parasitic protozoans worms and arthropods are more complex and heterogeneous organisms than pathogenic bacteria and viruses This notion implies different evolutionary strategies of host exploitation Typically parasites establish long term infections and induce relatively little mortality as they often limit pathological changes by modulating host cells and downregulating adverse immune responses Their pattern of distribution tends to be endemic rather than epidemic Despite these seemingly benign traits parasites usually cause substantial chronic morbidity thus constituting an enormous socioeconomic burden in humans particularly in resource poor countries and in livestock worldwide Parasite induced fitness costs are an evolutionary force that can shape populations and contribute to species diversity Therefore a thorough understanding of parasites and parasitic diseases requires detailed knowledge of the respective biochemical molecular and immunological aspects as well as of population genetics epidemiology and ecology This Research Topic RT bridges disciplines to connect molecular immunological and wildlife aspects of parasitic infections The RT puts emphases on four groups of parasites *Plasmodium Toxoplasma Giardia* and intestinal helminths Co infections are also covered by the RT as they represent the most common form of parasite infections in wildlife and domestic animal populations Within the four types of parasites the following topics are addressed 1 Experimental models hypothesis testing translation and limits 2 Critical appraisal of experimental models 3 Natural systems Technological advances for investigations in natural parasite host systems and studies in natural systems 4 The urgent need for better models and methods in natural parasite systems Hence the RT covers and illustrate by the means of four main parasitic infections the parasite host system at the molecular cellular and organismic level

[The Basic Principles of Insect Population Suppression and Management](#) E. F. Knipling, 1979 **Breaking the cycle: attacking the malaria parasite in the liver** Ute Frevert, Urszula Krzych, Thomas L. Richie, 2016-01-06 Despite significant progress in the global fight against malaria this parasitic infection is still responsible for nearly 300 million clinical cases and more than half a million deaths each year predominantly in African children less than 5 years of age The infection starts when mosquitoes transmit small numbers of parasites into the skin From here the parasites travel with the bloodstream to the liver where they undergo an initial round of replication and maturation to the next developmental stage that infects red blood cells A vaccine capable of blocking the clinically silent liver phase of the Plasmodium life cycle would prevent the subsequent symptomatic phase of this tropical disease including its frequently fatal manifestations such as severe anemia acute lung injury and cerebral malaria Parasitologists immunologists and vaccinologists have come to appreciate the complexity of the adaptive immune response against the liver stages of this deadly parasite Lymphocytes play a central role in the elimination of Plasmodium infected hepatocytes both in humans and animal models but our understanding of the exact cellular interactions and molecular effector mechanisms that lead to parasite killing within the complex hepatic microenvironment of an immune host is still rudimentary Nevertheless recent collaborative efforts have led to promising vaccine approaches based on liver stages that have conferred sterile immunity in humans the University of Oxford's Ad prime MVA boost vaccine the Naval Medical Research Center's DNA prime Ad boost vaccine Sanaria Inc's radiation attenuated whole sporozoite vaccine and Radboud University Medical Centre's and Sanaria's derived chemoprophylaxis with sporozoites vaccines The aim of this Research Topic is to bring together researchers with expertise in malariology immunology hepatology antigen discovery and vaccine development to provide a better understanding of the basic biology of Plasmodium in the liver and the host's innate and adaptive immune responses Understanding the conditions required to generate complete protection in a vaccinated individual will bring us closer to our

ultimate goal namely to develop a safe scalable and affordable malaria vaccine capable of inducing sustained high level protective immunity in the large proportion of the world's population constantly at risk of malaria
