1 2 ARTIFICIAL INTELLIGENCE

We all now have a general understanding of artificial intelligence and how it works To summarise the information that was presented in the introduction artificial intelligence AI can be defined as a vast branch of computer science that endeavors to build smart entities capable of performing intelligent tasks without human intervention In other words AI is the simulation of human intelligence in machines which grants them the capabilities to mimic and behave like humans These entities are grouped under a single umbrella term known as Intelligent Agents IA If an entity can see its surroundings comprehend it and act upon it then that creature is considered an IA It is possible to perceive it as being composed of three halves First there are the Sensors in the system It is a reference to the portion of the AI that is responsible for assisting it in perceiving stimuli from the outside environment The Actuators are the second entity in the system AI can include methods that create the required effects with the assistance of this The third component of the agent is the Effector which is utilized by the agent to exert its influence on the surrounding environment Consequently we can comprehend the idea of PEAS from this Performance Measurement Environment Actuator and Sensor are the components that make up PEAS Using PEAS we can gain a more in depth understanding of Intelligent Agents which in turn helps us develop more effective Rational Agents A performance metric is a judgment of how well something is performing Environment is a term that relates to the surrounding environment which includes the entities that are doing the act Actuators are the components or instruments that are essential to the operation of the mechanism
