Mihailidis,Jennifer Boger,Henry Kautz,2008 This publication presents articles on Aging in Place Assistive Technology
Monitoring and Telehealth Transportation and Mobility and Design The section on assistive technology AT represents
arguably the most mature and generic aspect of technology and aging except that AT can hardly be regarded really as a
specific discipline any longer Assistive devices and systems command an expansive gamut of technological and engineering
specialties drawing upon mechanical engineering and industrial design at one end of the field and cybernetic systems
engineering and brain computer user interfaces at the other The largest section in the book on monitoring and telehealth
reveals novel applications of advanced pattern recognition techniques some of which have up to now found roles primarily in
the military process engineering and financial sectors Transportation and mobility still represents by far the largest and most

commercially lucrative market segment of technology for seniors There is however a clear trend towards synthesis of information and communication technologies ICT and mobility technologies which is embodied in the latest developments of automatic collision avoidance and full or semi autonomous navigation functions in powered mobility devices The last section is dedicated to design issues It is proposed that designing for the special needs market before making a design as inclusive as possible to the mainstream market is a viable alternative to the currently accepted notion of inclusive design provided that aesthetics are appropriately addressed To conclude we see a social shift from institutional to home based care in which information communication technology based solutions now afford the possibility of aging in place for the many thousands of people having mild to moderate cognitive impairment
