Book Description This book authored by a seasoned Senior Data Architect with 25 years of experience aims to help you achieve proficiency in using the AWS ecosystem for data engineering. This revised edition provides updates in every chapter to cover the latest AWS services and features, takes a refreshed look at data governance, and includes a brand new section on building modern data platforms which covers implementing a data mesh approach, open table formats such as Apache Iceberg, and using DataOps for automation and observability. You'll begin by reviewing the key concepts and essential AWS tools in a data engineer's toolkit and getting acquainted with modern data management approaches. You'll then architect a data pipeline, review raw data sources, transform the data, and learn how that transformed data is used by various data consumers. You'll learn how to ensure strong data governance and about populating data marts and data warehouses along with how a data lakehouse fits into the picture. After that, you'll be introduced to AWS tools for analyzing data, including those for ad hoc SQL queries and creating visualizations. Then, you'll explore how the power of machine learning and artificial intelligence can be used to draw new insights from data. In the final chapters, you'll discover transactional data lakes, data meshes, and how to build a cutting edge data platform on AWS. By the end of this AWS book, you'll be able to execute data engineering tasks and implement a data pipeline on AWS like a pro.

computing techniques has become more significant than ever. In general, soft computing methods are closely similar to biological processes than traditional techniques which are mostly based on formal logical systems such as sentential logic and predicate logic or rely heavily on computer aided numerical analysis. Soft computing techniques are anticipated to complement each other. The aim of these techniques is to accept imprecision, uncertainties and approximations to get a rapid solution. However, recent advancements in representation, soft computing algorithms, fuzzy logic, evolutionary computation, machine learning and probabilistic reasoning generate a more intelligent and robust system providing a human interpretable, low cost approximate solution. Soft computing based algorithms have demonstrated great performance to a variety of areas including multimedia retrieval, fault tolerance system modelling, network architecture, Web semantics, big data analytics, time series, biomedical and health informatics etc. Soft computing approaches such as genetic programming, GP, support vector machine, firefly algorithm, SVM, FFA, artificial neural network, ANN and support vector machine wavelet, SVM Wavelet have emerged as powerful computational models. These have also shown significant success in dealing with massive data analysis for large number of applications. All the researchers and practitioners will be highly benefited, those who are working in field of computer engineering, medicine, biology, application, signal processing and mechanical engineering. This book is a good collection of state of the art approaches for soft computing based applications to various engineering fields. It is very beneficial for the new researchers and practitioners working in the field to quickly know the best performing methods. They would be able to compare different approaches and can carry forward their research in the most important area of research which has direct impact on betterment of the human life and health. This book is very useful because there is no book in the market which provides a good collection of state of the art methods of soft computing based models for multimedia retrieval, fault tolerance system modelling, network architecture, Web semantics, big data analytics, time series and biomedical and health informatics.
