Flexible Workflows Lisa Grumbach,2023-07-15 Traditional workflow management systems support the fulfillment of business tasks by providing guidance along a predefined workflow model Due to the shift from mass production to customization flexibility has become important in recent decades but the various approaches to workflow flexibility either require extensive knowledge acquisition and modeling or active intervention during execution Pursuing flexibility by deviation compensates for these disadvantages by allowing alternative paths of execution at run time without requiring adaptation to the workflow model This work Flexible Workflows A Constraint and Case Based Approach proposes a novel approach to flexibility by deviation the aim being to provide support during the execution of a workflow by suggesting items based on predefined strategies or experiential knowledge even in case of deviations The concepts combine two familiar methods from the field of AI constraint satisfaction problem solving and process oriented case based reasoning The combined model increases the capacity for flexibility The experimental evaluation of the approach consisted of a simulation involving

several types of participant in the domain of deficiency management in construction The book contains 7 chapters covering foundations domains and potentials prerequisites constraint based workflow engine case based deviation management prototype and evaluation together with an introduction a conclusion and 3 appendices Demonstrating high utility values and the promise of wide applicability in practice as well as the potential for an investigation into the transfer of the approach to other domains the book will be of interest to all those whose work involves workflow management systems **Cambridge Business English Dictionary** Roz Combley,2011-11-10 The most up to date business English dictionary created specially for learners of English **Digital Electronics** Dr. P. Kannan,Mrs. M. Facello,1996 Abstract Macromolecules such as proteins and DNA have complex spatial structures which are often important for their biological functions The idea of molecular shape and shape complementarity play crucial roles in protein folding conformational stability molecular solubility crystal packing and docking Various models based on a union of balls representation have been suggested for representing molecular shape including the van der Waals model the solvent accessible surface and the molecular surface In this thesis we present several extensions to the theory of Alpha shapes applicable to the analysis of molecular shape First we define a pocket of a molecule which is intuitively a depression canyon or cavity of a molecule The definition is based on mathematical notions of relative distance We give efficient algorithms for computing pockets and examples of their application Secondly we look at the issue of maintaining shape dynamically as a molecule changes over time Topological analysis of the changing structure can yield information about the function of the molecule We describe algorithms and their implementations for

dynamically maintaining the Delaunay complex the basis for shape analysis These algorithms have been implemented and experimental results are reported Finally we discuss techniques for modelling uniform growth of the atoms of a molecule The solvent accessible and molecular surface models of a molecule are based on such growth and the algorithms presented here efficiently compute these models for all probe sizes

A neutrosophic set-based TLBO algorithm for the flexible job-shop scheduling problem with routing flexibility and uncertain processing times Liangliang Jin, Chaoyong Zhang, Xiaoyu Wen, Chengda Sun, Xinjiang Fei, Different with the plain flexible job shop scheduling problem FJSP the FJSP with routing flexibility is more complex and it can be deemed as the integrated process planning and job shop scheduling IPPS problem where the process planning and the job shop scheduling two important functions are considered as a whole and optimized simultaneously to utilize the flexibility in a flexible manufacturing system Although many novel meta heuristics have been introduced to address this problem and corresponding fruitful results have been observed the dilemma in real life applications of resultant scheduling schemes stems from the uncertainty or the nondeterminacy in processing times since the uncertainty in processing times will disturb the predefined scheduling scheme by influencing unfinished operations As a result the performance of the manufacturing system will also be deteriorated Nevertheless research on such issue has seldom been considered before This research focuses on the modeling and optimization method of the IPPS problem with uncertain processing times The neutrosophic set is first introduced to model uncertain processing times Due to the complexity in the math model we developed an improved teaching learning based optimization TLBO algorithm to capture more robust scheduling schemes
