Dietary Reference Intakes for Calcium, Phosphorus, Magnesium, Vitamin D, and Fluoride Institute of Medicine, Food and Nutrition Board, Standing Committee on the Scientific Evaluation of Dietary Reference Intakes, 1999-10-17

Since 1941 Recommended Dietary Allowances RDAs has been recognized as the most authoritative source of information on nutrient levels for healthy people. Since publication of the 10th edition in 1989 there has been rising awareness of the impact of nutrition on chronic disease. In light of new research findings and a growing public focus on nutrition and health the expert panel responsible for formulation RDAs reviewed and expanded its approach the result Dietary Reference Intakes. This new series of references greatly extends the scope and application of previous nutrient guidelines. For each nutrient the book presents what is known about how the nutrient functions in the human body what the best method is to determine its requirements which factors caffeine or exercise for example may affect how it works and how the nutrient may be related to chronic disease. The first volume of Dietary Reference Intakes includes calcium phosphorus magnesium vitamin D and fluoride. The second book in the series presents information about thiamin riboflavin niacin vitamin B6 folate vitamin B12 pantothenic acid biotin and choline. Based on analysis of nutrient metabolism in humans and data on intakes in the U S population the committee recommends intakes for each age group from the first days of life through childhood sexual maturity midlife and the later years. Recommendations for pregnancy and lactation also are made and the book identifies when intake of a nutrient may be too much. Representing a new paradigm for the nutrition community Dietary Reference Intakes encompasses Estimated Average Requirements EARs. These are used to set Recommended Dietary Allowances. Recommended Dietary Allowances RDAs. Intakes that meet the RDA are likely to meet the nutrient requirement of nearly all individuals in a life stage and gender group. Adequate Intakes AIs. These are used instead of RDAs when an EAR cannot be calculated. Both the RDA and the AI may be used as goals for individual intake. Tolerable Upper Intake Levels ULs. Intakes below the UL are unlikely to pose risks of adverse health effects in healthy people. This new framework encompasses both essential nutrients and other food components thought to play a role in health such as dietary fiber. It incorporates functional endpoints and examines the relationship between dose and response in determining adequacy and the hazards of excess intake for each nutrient.
