Products are getting increasingly complex and customers expect a higher level of customization and quality. Manufacturing in the Era of 4th Industrial Revolution explores three technologies that are the building blocks of the next generation advanced manufacturing. The first technology covered in Volume 1 is Additive Manufacturing (AM). AM has emerged as a very popular manufacturing process. The most common form of AM is referred to as three-dimensional (3D) printing. Overall, the revolution of additive manufacturing has led to many opportunities in fabricating complex, customized and novel products. As the number of printable materials increases and AM processes evolve, manufacturing capabilities for future engineering systems will expand rapidly, resulting in a completely new paradigm for solving a myriad of global problems. The second technology is industrial robots, which is covered in Volume 2 on Robotics. Traditionally, industrial robots have been used on mass production lines where the same manufacturing operation is repeated many times. Recent advances in human-safe industrial robots

present an opportunity for creating hybrid work cells where humans and robots can collaborate in close physical proximities. This Cobots or collaborative robots has opened up to opportunity for humans and robots to work more closely together. Recent advances in artificial intelligence are striving to make industrial robots more agile with the ability to adapt to changing environments and tasks. Additionally, recent advances in force and tactile sensing enable robots to be used in complex manufacturing tasks. These new capabilities are expanding the role of robotics in manufacturing operations and leading to significant growth in the industrial robotics area. The third technology covered in Volume 3 is augmented and virtual reality. Augmented and virtual reality AR VR technologies are being leveraged by the manufacturing community to improve operations in a wide variety of ways. Traditional applications have included operator training and design visualization with more recent applications including interactive design and manufacturing planning, human and robot interactions, ergonomic analysis, information and knowledge capture, and manufacturing simulation. The advent of low cost solutions in these areas is accepted to accelerate the rate of adoption of these technologies in the manufacturing and related sectors. Consisting of chapters by leading experts in the world, *Manufacturing in the Era of 4th Industrial Revolution* provides a reference set for supporting graduate programs in the advanced manufacturing area. *Wearable Robots* José L. Pons, 2008-04-15. A wearable robot is a mechatronic system that is designed around the shape and function of the human body with segments and joints corresponding to those of the person it is externally coupled with. Teleoperation and power amplification were the first applications but after recent technological advances the range of application fields has widened. Increasing recognition from the scientific community means that this technology is now employed in telemanipulation, man amplification, neuromotor control, research and rehabilitation, and to assist with impaired human motor control. Logical in structure and original in its global orientation, this volume gives a full overview of wearable robotics providing the reader with a complete understanding of the key applications and technologies suitable for its development. The main topics are demonstrated through two detailed case studies: one on a lower limb active orthosis for a human leg and one on a wearable robot that suppresses upper limb tremor. These examples highlight the difficulties and potentialities in this area of technology illustrating how design decisions should be made based on these. As well as discussing the cognitive interaction between human and robot, this comprehensive text also covers the mechanics of the wearable robot and its biomechanical interaction with the user, including state of the art technologies that enable sensory and motor interaction between human biological and wearable artificial mechatronic systems, the basis for bioinspiration and biomimeticism, general rules for the development of biologically inspired designs, and how these could serve recursively as biological models to explain biological systems, the study on the development of networks for wearable robotics. *Wearable Robotics: Biomechatronic Exoskeletons* will appeal to lecturers, senior undergraduate students, postgraduates, and other researchers of medical, electrical, and bio engineering who are interested in the area of assistive robotics. Active system developers in this sector of the engineering industry will also
