Atlas of Hematologic Neoplasms Tsieh Sun, 2009-06-12

Due to its rapid development in recent years hematopathology has become a very complicated discipline. The current development is mainly in two aspects: the new classification of lymphomas and leukemias and the new techniques. The Revised European American Classification of Lymphoid Neoplasms (REAL) classification and the World Health Organization (WHO) classification of hematologic neoplasms require not only morphologic criteria but also immunophenotyping and molecular genetics for the diagnosis of hematologic tumors. Immunophenotyping is performed by either flow cytometry or immunohistochemistry. There are many new monoclonal antibodies and new equipments accumulated in recent years that make immunophenotyping more or more accurate and helpful. There are even more new techniques invented in recent years in the field of molecular genetics. In cytogenetics, the conventional karyotype is supplemented and partly replaced by the fluorescence in situ hybridization (FISH) technique. The current development of gene expression profiling is even more powerful in terms of subtyping the hematologic tumors which may help guiding the treatment and predict the prognosis. In molecular biology, the tedious Southern blotting technique is largely replaced by polymerase chain reaction (PCR). The recent development in reverse transcriptase PCR and quantitative PCR makes these techniques even more versatile. Because of these new developments, hematopathology has become too complicated to handle by a general pathologist. Many hospitals have to hire a newly trained hematopathologist to oversee peripheral blood, bone marrow, and lymph node examinations. These young hematopathologists are geared to the new techniques but most of them are inexperienced in morphology. No matter how well trained a hematopathologist is, he or she still needs to see enough cases so that they can recognize the morphology and use the new techniques to substantiate the diagnosis. In other words, morphology is still the basis for the diagnosis of lymphomas and leukemias. Therefore, a good color atlas is the most helpful tool for these young hematopathologists and for the surgical pathologists who may encounter a few cases of hematologic tumors from time to time. In a busy daily practice, it is difficult to refer to a comprehensive hematologic textbook all the time. There are a few hematologic color atlases on the market to show the morphology of the normal blood cells and hematologic tumor cells. These books are helpful but not enough because tumor cell morphology is variable from case to case and different kinds of tumor cells may look alike and need to be differentiated by other parameters. The best way to learn morphology is through the format of clinical case study. This format is also consistent with the daily practice of hematopathologists and with the pattern in all the specialty board examinations. Therefore, it is a good learning tool for the pathology residents, hematology fellows, as well as medical students. This proposed book will present 83 clinical cases with clinical history, morphology of the original specimen, and a list of differential diagnoses. This is followed by further testing with pictures to show the test results. At the end, a correct diagnosis is rendered with subsequent brief discussion on how the diagnosis is achieved. A few useful references will be cited, and a table will be provided for differential diagnosis in some

cases The major emphasis is the provision of 500 color photos of peripheral blood smears bone marrow aspirates core biopsy lymph node biopsy and biopsies of other solid organs that are involved with lymphomas and leukemias Pictures of other diagnostic parameters such as flow cytometric histograms immunohistochemical stains cytogenetic karyotypes fluorescence in situ hybridization and polymerase chain reaction will also be included A comprehensive approach with consideration of clinical morphologic immunophenotypic and molecular genetic aspects is the best way to achieve a correct diagnosis After reading this book the reader will learn to make a diagnosis not only based on the morphology alone but also in conjunction with other parameters *Anticancer Research*, 2008 *Hematology, an Atlas and Diagnostic Guide* Nora C. Flow Cytometry, Immunohistochemistry, and Molecular Genetics for Hematologic Neoplasms Tsieh Sun, 2012-01-19 Immunophenotyping is the most powerful tool in the routine diagnosis of hematologic neoplasms Immunohistochemical technique is used in histology labs for this purpose while flow cytometry is used in clinical labs Although separately these 2 techniques are very useful in detecting lymphomas and leukemias the combination of both creates a very powerful and definitive diagnostic tool The addition of molecular genetics to the book makes it an all encompassing reference text *Magill's Medical Guide* Anne Chang, 2008 Covers diseases disorders treatments procedures specialties anatomy biology and issues in an A Z format with sidebars addressing recent developments in medicine and concise information boxes for all diseases and disorders **National Library of Medicine Current Catalog** National Library of Medicine (U.S.), *Modern Modalities for the Diagnosis of Hematologic Neoplasms* Chin-Yang Li, Lung T. and duplication syndromes gene related organ and tissue defects cancer predisposition to different types of tumors and reproduction failure has been reported in the literature However the cases of RCs reported in the literature account for less than 1% of its real occurrence Current diagnostic practice lacks laboratory standards for analyzing cellular behavior and genomic imbalances of RCs to evaluate its compound effects on patients The under representation of clinical cases and the lack of comprehensive diagnostic analysis make challenging to establish accurate clinico cytogenomic correlations Given recent advances in genomic technology and organized efforts from peer experts standardized cytogenomic diagnosis and evidence based clinical management could be envisioned for all patients with RCs Furthermore supernumerary small ring chromosomes and the patient's perspective are addressed the latter by including family stories of RC carrier relatives Acquired RCs in various cancers are also discussed as well as the potential role of RCs in research applications like iPSC cellular modeling and genomic editing This book is a valuable reference for clinical geneticists personnel in cytogenetics and molecular genetics laboratories genetic counselors and researchers in related fields *Color Atlas--text of Flow Cytometric Analysis of Hematologic Neoplasms* Tsieh Sun, 1993 *Concise Pathology* Para Chandrasoma, Clive Roy Taylor, 1991
