

NERVOUS SYSTEM

DEFINITION OF THE CENTRAL NERVOUS SYSTEM

As you think, see, breath, and do everything throughout the day you are using your central nervous system. It is the system of the body that receives and processes all information from all parts of the body. It consists of the brain, the spinal cord, and neurons. It is arguably the most important system of the body.

PARTS AND FUNCTIONS OF THE CENTRAL NERVOUS SYSTEM

Neurons are the basic units that make up the nervous system. All cells of the nervous system are made of neurons. Neurons are able to transmit electrical impulses throughout the body as signals that cause a response. There are three types of neurons, known as motor, sensory, or interneurons. Motor neurons transmit information between organs, glands, and muscles. Sensory neurons send information to the brain and spinal cord from internal organs or external stimuli encountered by the parts of the body. Interneurons act as messengers that relate signals between motor and sensory neurons.

The **brain** is the control center of the body. The brain is typically considered to have three main parts: the forebrain, the hindbrain, and the brain stem. The forebrain receives and processes sensory information such as thinking, understanding and producing language, and motor functions. The **forebrain** consists of the thalamus, hypothalamus, cerebrum, and cerebral cortex.
