Networks and Graphs: Spanning Trees

VII.B Student Activity Sheet 7: Minimal Spanning Trees

A railroad system connecting five cities is being planned. The goal is to build this system using the least amount of money, while ensuring that each city can be reached by any other city in the system. Based on the distance and terrain, the following chart gives estimates for the cost, in hundreds of thousands of dollars, to build a railroad between any two cities.

	City A	City B	City C	City D	City E
City A		10	5	4	2
City B			7	9	11
City C				5	10
City D					12

1. Create a graph to model the costs contained in the table.
2. Restate the railroad problem using the terminology associated with graphs (for example, *vertices*, *edges*, *paths*, *cycles*).
3. Construct two different graphs that represent possible railroad networks, and calculate the total cost to build each rail system.
4. What rail system leads to the lowest construction cost?
5. How did you arrive at the most efficient rail system? State your answer in a step-by-step algorithm that someone else could follow.

The rise of the Internet and the wide availability of inexpensive computers have made it possible to gather and analyze network data on an unprecedented scale and the development of new theoretical tools has allowed us to extract knowledge from networks of many different kinds. The study of networks is broadly interdisciplinary and central developments have occurred in many fields including mathematics physics computer and information sciences biology and the social sciences. This book brings together the most important breakthroughs in each of these fields and presents them in a coherent fashion highlighting the strong interconnections between work in different areas. Topics covered include the measurement of networks methods for analyzing network data including methods developed in physics statistics and sociology fundamentals of graph theory computer algorithms mathematical models of networks including random graph models and generative models and theories of dynamical processes taking place on networks. **Contemporary Mathematics in Context**, 1998 Blackline masters suitable for making transparencies to facilitate class discussions helping organize student work and assisting with graphics calculator instruction. **Jacaranda Maths Quest 12 General Mathematics VCE Units 3 and 4 7e learnON and Print** Mark Barnes, Pauline Holland, Jennifer Nolan, Geoff

Applegate, 2007 Proceedings of the Seventh SIAM International Conference on Data Mining **Integer Programming and Network Models** H.A. Eiselt, Carl-Louis Sandblom, 2000-08-15 The purpose of this book is to provide readers with an introduction to the very active field of integer programming and network models The idea is to cover the main parts of the field without being too detailed or too technical As a matter of fact we found it somewhat surprising that most especially newer books are strongly algorithmically oriented In contrast the main emphasis of this book is on models rather than methods This focus expresses our view that methods are tools to solve actual problems and not ends in themselves As such graduate and with some omissions undergraduate students may find this book helpful in their studies as will practitioners who would like to get acquainted with a field or use this text as a refresher This premise has resulted in a coverage that omits material that is standard fare in other books whereas it covers topics that are only infrequently found elsewhere There are some yet relatively few prerequisites for the reader Most material that is required for the understanding of more than one chapter is presented in one of the four chapters of the introductory part which reviews the main results in linear programming the analysis of algorithms graphs and networks and dynamic programming respectively Readers who are familiar with the issues involved can safely skip that part The three main parts of the book rely on intuitive reasoning and examples whenever practical instead of theorems and proofs
