

NEURAL TISSUE

Introduction

- ▶ **Neurons** are the basic functional units of the nervous system. Neurons are individual cells.
- ▶ **Neuroglia** are supporting cells for the neurons. They have functions that are essential to the survival and functionality of neurons. They separate and protect neurons.

Anatomical Division of the Nervous System

- ▶ **Central Nervous System (CNS)**—consists of the spinal cord and brain. Responsible for integrating, processing, and coordinating sensory data and motor commands
- ▶ **Peripheral Nervous System (PNS)**—includes all the neural tissue outside of the CNS. PNS delivers sensory information to the CNS and carries motor commands to peripheral tissues and systems
- ▶ Nerves connected to the brain are called cranial nerves. Nerves attached to the spine are called spinal nerves

Functional Divisions of the Nervous System

PNS is divided into afferent and efferent divisions

The **afferent division** brings sensory information to the CNS from receptors in peripheral tissues and organs.

The **efferent division** carries motor commands from the CNS to muscles, glands, and adipose tissues. The target organs, which respond by doing something are called effectors.

Efferent division has both somatic and autonomic components:

-**Somatic Nervous System (SNS)**: -controls skeletal muscle contractions. Voluntary contractions are under conscious control. Involuntary contractions are controlled at the subconscious level, an example of this is a reflex.

-**Autonomic Nervous System (ANS)**: -provides automatic regulation of smooth muscle, cardiac muscle, glandular secretions, and adipose tissue at the subconscious level. Has sympathetic and parasympathetic divisions
