

10 PRINCIPLES OF NEUROPLASTICITY

Neuroplasticity is the brain's remarkable ability to form new pathways and strengthen connections – even following injury. Use these principles to make the most of your rehabilitation and create positive changes in your brain.

USE IT OR LOSE IT

Every thought, action, movement, and skill has a specific set of connections in your brain. When you don't practice something for an extended period of time, the pathways for that task start to weaken, and they get weaker over time.

USE IT & IMPROVE IT

However, if you practice something a lot, these connections can grow and become stronger. Training a thought or a behavior (and doing it regularly) can lead to improved speed and performance.

SALIENCE

Emotions can affect the strength of memory consolidation. If therapy is made interesting or important to you (ex: incorporating hobbies or interests), you can more easily remember new skills or pieces of information.

REPETITION

Repetition of a learned (or re-learned) behavior is required for long-term changes in the brain. You need thousands of repetitions to master a skill. The more time you've spent practicing, the better you perform.

INTENSITY

If you do something that doesn't challenge you, you won't see much of a difference. Intensity can be the number of times you do an exercise or how difficult it is. Try to find an intensity that is one step above your current level.

SPECIFICITY

You have to train your brain in very specific ways. Learning something new or re-training an old skill (rather than going through the motions of something you already know) helps increase connections in the brain.

AGE

Our brains are the most flexible and adaptive when we are young. But brains can grow and change at any age! Effects are generally better in individuals with greater physical and mental activity.

TIME

If therapy targets changing, increasing, and strengthening the pathways in your brain (using these principles), it should work any time. However, there may be windows of time where progress happens at a faster rate.

TRANSFERENCE

Learning in one situation (like therapy) can generalize to other situations (like social settings). Similarly, training one specific skill can sometimes activate the pathways of nearby, untrained items and improve those skills as well.

INTERFERENCE

Neuroplasticity means the brain is always learning. But it doesn't know the difference between good and bad. Maladaptive habits or practicing the wrong things might interfere with the changes you want to make.
