Neural Plasticity Across the Lifespan Gianfranco Denes, 2015-12-14 Neural Plasticity Across the Lifespan reviews the recent scientific developments which are transforming our understanding of the human brain For many years it was thought that modifications to the structural and functional organization of the brain were limited to a short early period of life the critical period and in adults to the memory system Recent research suggests that on the contrary we should see the human brain as a flexible structure which adapts and modifies in response to learning sensory experience age and disease The book provides an integrated overview of contemporary research on neural plasticity the process by which the brain can change in structure and function to cope with new experiences and react to the effects of acquired damage or sensory deprivation It reviews data on plasticity in the developing brain looking at both typical and atypical development alongside clinical and observational research on the adult population It covers a number of key topics including different forms of neural plasticity factors affecting neural plasticity ageing and gender neural plasticity in language acquisition memory and bodily self consciousness mechanisms of repair plasticity following sensory deprivation and acquired brain damage This is an accessible overview of an emerging field of research which has fundamental implications for how we perceive our potential to change throughout our lives It will be essential reading for all students of cognitive development cognitive neuroscience and lifespan development

[Consciousness and Neural Plasticity](#) Morten Overgaard, Mads Jensen, 2012-01-01 In contemporary consciousness studies the phenomenon of neural plasticity has received little attention despite the fact that neural plasticity is of still increased interest in neuroscience We will however argue that neural plasticity could be of great importance to consciousness studies If consciousness is related to neural processes it seems at least prima facie that the ability of the

neural structures to change should be reflected in a theory of this relationship Neural plasticity refers to the fact that the brain can change due to its own activity The brain is not static but rather a dynamic entity which physical structure changes according to its use and environment This change may take the form of growth of new neurons the creation of new networks and structures and change within network structures that is changes in synaptic strengths Plasticity raises questions about the relation between consciousness and brain functions If consciousness is connected to specific brain structures as a function or in identity what happens to consciousness when those specific underlying structures change It is therefore possible that the understanding and theories of neural plasticity can have direct consequences for a theory about consciousness For instance theories of strict identity between consciousness and structure may face the serious dilemma to either accept that say the experience of the colour red is fundamentally different in one individual over time due to cortical changes or to abandon the strong identity thesis altogether Were one to pursue a theory according to which consciousness is not an epiphenomenon to brain processes consciousness may in fact affect its own neural basis The neural correlate of consciousness is often seen as a stable structure that is something that is stable over time Considering neural plasticity this is not necessarily so The NCC might change and hence literally change the way a person is conscious What it is about the NCC that can and might change is even though it can be relevant for the relation between the brain and consciousness is still an unanswered question There are hence a lot of questions that might shed light upon the relevant but unknown relations between consciousness and the brain Therefore We hereby propose to do a Research Topic on consciousness and neural plasticity to shed light on these underestimated issues In contemporary consciousness studies the phenomenon of neural plasticity has received little attention despite the fact that neural plasticity is of still increased interest in neuroscience We will however argue that neural plasticity could be of great importance to consciousness studies If consciousness is related to neural processes it seems at least prima facie that the ability of the neural structures to change should be reflected in a theory of this relationship Neural plasticity refers to the fact that the brain can change due to its own activity The brain is not static but rather a dynamic entity which physical structure changes according to its use and environment This change may take the form of growth of new neurons the creation of new networks and structures and change within network structures that is changes in synaptic strengths Plasticity raises questions about the relation between consciousness and brain functions If consciousness is connected to specific brain structures as a function or in identity what happens to consciousness when those specific underlying structures change It is therefore possible that the understanding and theories of neural plasticity can have direct consequences for a theory about consciousness For instance theories of strict identity between consciousness and structure may face the serious dilemma to either accept that say the experience of the colour red is fundamentally different in one individual over time due to cortical changes or to abandon the strong identity thesis altogether Were one to pursue a theory according to which consciousness is not an epiphenomenon to brain processes consciousness may in fact
