

Motor Calculations

To prevent a motor from burning up, you must provide a means of protecting it from overcurrent (overload, short circuit, or ground fault). If you can remember not to confuse motor protection with circuit protection, you'll eliminate a major point of confusion in motor calculations.

Fig. 1. Conductors for a single motor must have an ampacity of not less than 125% of the motor full-load current rating.

Looking at Figure 430.1 in the NEC will help you keep this distinction clear. Notice that it shows the requirements for motor overload protection in Part III and the requirements for short-circuit and ground-fault protection in Parts IV and V.

Table or nameplate? To determine the minimum ampacity of the motor supply conductors, you obviously need to know how much current the motor draws. But there are different types of current in motor applications (see Motor Current Basics on page 30). Which do you use — full-load current (FLC) or full-load amperes (FLA) — for your motor calculations?
