Oral Cancer Diagnosis Management And Rehabilitation:

Oral Cancer John W. Werning, 2011-01-01 Oral Cancer Diagnosis Management and Rehabilitation provides readers with a systematic review of the diagnostic and treatment principles that maximize the outcomes of patients who have been diagnosed with oral cancer. Written by authorities in the fields of head and neck surgical oncology, radiation oncology, reconstructive surgery, dentistry, and oral and maxillofacial surgery, this textbook provides clinicians with a unified management philosophy that is firmly based upon the best available evidence in the peer-reviewed literature. In-depth clinical reviews of preferred treatment approaches and reconstructive techniques for each oral mucosal site facilitate the development of effective treatment strategies that are tailored to the location and extent of the lesion. The book describes the interrelationship between the site of oral cancer involvement and its impact on outcomes such as local, regional, cancer control, and quality of life following treatment. Features insightful reviews of controversial clinical issues such as the management of early mandibular invasion and the clinically negative neck. Step-by-step descriptions of surgical techniques which improve access to particular regions of the oral cavity permit the resection of tumors with minimal morbidity and result in optimal reconstructive outcomes. Exhaustive coverage of topics that have heretofore received limited attention in textbooks devoted to oral cancer, including the evaluation and management of oral premalignant lesions, osseointegrated implantation, and dental implant imaging and orofacial pain. Educational photographs and illustrations highlighting important teaching points and critical nuances in surgical technique. Ideal for reading cover to cover, this book is both an indispensable reference for experienced clinicians and an essential educational tool for residents and other members of the multidisciplinary oral cancer team. *Oral Cancer* Robert A. Ord, Remy H. Blanchaert, 2000 Oral Cancer Metastasis Jeffrey Myers, 2009-11-11 Squamous cell carcinoma of the oral cavity (SCCOC) is one of the most prevalent tumors of the head and neck region. Despite improvements in treatment, the survival of patients with SCCOC has not significantly improved over the past several decades. Most frequently, treatment failure takes the form of local and regional recurrences, but as disease control in these areas improves, SCCOC treatment failures more commonly occur as distant metastasis. The presence of cervical lymph node metastasis is the most reliable adverse prognostic factor in patients with SCCOC and extracapsular spread. ECS of cervical lymph nodes metastasis is a particularly reliable predictor of regional and distant recurrence and death from disease. Decisions regarding elective and therapeutic management of cervical lymph node metastases are made mainly on clinical grounds as we cannot always predict cervical lymph node metastasis from the size and extent of invasion of the primary tumors. Therefore, the treatment of the neck disease in the management of SCCOC remains controversial. The promise of using biomarker-based treatment decisions has yet to be fully realized due to our poor understanding of the mechanisms of regional and distant metastases of SCCOC. We will summarize the current status of investigations into SCCOC metastases and potential of these studies to impact basic research investigators and clinicians confronting SCCOC in the
