Organic Chemistry I Super Review:

Biotransformations in Organic Chemistry Kurt Faber, 2017-11-26 This well established textbook on biocatalysis provides a basis for undergraduate and graduate courses in modern organic chemistry as well as a condensed introduction into this field After a basic introduction into the use of biocatalysts principles of stereoselective transformations enzyme properties and kinetics the different types of reactions are explained according to the reaction principle such as hydrolysis reduction oxidation C C bond formation etc Special techniques such as the use of enzymes in organic solvents immobilization techniques artificial enzymes and the design of cascade reactions are treated in a separate section A final chapter deals with the basic rules for the safe and practical handling of biocatalysts The use of biocatalysts employed either as isolated enzymes or whole microbial cells offers a remarkable arsenal of highly selective transformations for state of the art synthetic organic chemistry Over the last two decades this methodology has become an indispensable tool for asymmetric synthesis not only at the academic level but also on an industrial scale In this 7th edition new topics have been introduced which include alcohol and amine oxidases amine dehydrogenases imine reductases haloalkane dehalogenases ATP independent phosphorylation Michael additions and cascade reactions This new edition also emphasizes the use of enzymes in industrial

Organic Chemistry — A Textbook Kurt Faber, 2012-12-06 The use of natural catalysts enzymes for the transformation of non natural man made organic compounds is not at all new they have been used for more than one hundred years employed either as whole cells cell organelles or isolated enzymes 1 Certainly the object of most of the early research was totally different from that of the present day Thus the elucidation of biochemical pathways and enzyme mechanisms was the main reason for research some decades ago It was mainly during the 1980s that the enormous potential of applying natural catalysts to transform non natural organic compounds was recognized What started as a trend in the late 1970s could almost be called a fashion in synthetic organic chemistry in the 1990s Although the early euphoria during the gold rush in this field seems to have eased somewhat there is still no limit to be seen for the future development of such methods As a result of this

extensive recent research there have been all estimated 8000 papers published on the subject 2 14 To collate these data as a kind of super review would clearly be an impossible task and furthermore such a hypothetical book would be unpalatable for the non expert
