

Motor Cognition

Overview

- Many people believe processes used to plan and enact a movement can be used in problem solving and reasoning
- Moreover, the processes involved in perceiving action are also involved in movement
- This lecture will introduce key ideas involved in motor cognition and memory for action needed
 - in planning, and producing our own actions; anticipating, perceiving, and interpreting the actions of others
 - In remembering actions

Motor Cognition Marc Jeannerod, 2006-06-29 Our ability to acknowledge and recognize our own identity our self is a characteristic doubtless unique to humans Where does this feeling come from How does the combination of neurophysiological processes coupled with our interaction with the outside world construct this coherent identity We know that our social interactions contribute via the eyes ears etc However our self is not only influenced by our senses It is also influenced by the actions we perform and those we see others perform Our brain anticipates the effects of our own actions and simulates the actions of others In this way we become able to understand ourselves and to understand the actions and emotions of others This book describes the new field of Motor Cognition Though motor actions have long been studied by neuroscientists and physiologists it is only recently that scientists have considered the role of actions in building the self How consciousness of action is part of self consciousness how one's own actions determine the sense of being an agent how actions performed by others impact on ourselves for understanding others differentiating ourselves from them and learning from them these questions are raised and discussed throughout the book drawing on experimental clinical and theoretical bases The advent of new neuroscience techniques such as neuroimaging and direct electrical brain stimulation together with a renewal of behavioral methods in cognitive psychology provide new insights into this area Mental imagery of action self recognition consciousness of actions imitation can be objectively studied using these new tools The results of these investigations shed light on clinical disorders in neurology psychiatry and in neuro development

Visual and Motor Cognition in Infants and Children Christiane Lange-Küttner, 2024-03-21 This insightful book offers an authoritative yet accessible introduction to the development of visual abilities and motor skills in infants and children Based on theory and cutting edge up to date research about the development of non verbal intelligence it provides readers with essential knowledge about the foundations of typical and atypical development Split into two parts the book begins by describing the development of components of non verbal intelligence in typical development Several studies are presented that document the importance of a transition from an object place to objects region encoding for proper spatial categorisation In the second part the book discusses which of the visual spatial motor imagery categorisation memory and planning processes may be affected in children with attention deficit hyperactivity disorder ADHD autistic spectrum disorder ASD and developmental coordination disorder DCD Lange K ttner introduces a Spatial Model that integrates object salience speed and abstraction of spatial patterns of locations re occurring at different ages She also develops a Spatial Freedom Theory that argues that spatial containment constraints and exploration belong together The book encourages and stimulates new research ideas by discussing the most important research results to date and identifying new research questions This text will be of interest to students and instructors as well as researchers in the fields of developmental clinical educational and cognitive psychology as well as neuroscience and physical education

The Intersection of Cognitive, Motor, and Sensory Processing in Aging: Links to Functional Outcomes, volume II Jeannette R. Mahoney, Uros Marusic, 2024-01-25 Given the success of the previous edition of this Research Topic we are pleased to announce the release of its second volume Age related changes can concurrently affect cognitive motor and sensory functioning and their interactions For instance age related unisensory impairments have been linked to slower gait functional mobility decline increased risks of falls and reduced quality of life Additionally balance impairments have been associated with inefficient interactions between musculoskeletal and sensory systems which are often compromised in aging Lastly inefficient multisensory integration processes have been linked to increased falls worse balance slower gait and increased cognitive impairments Consequently the successful interaction among sensory motor and cognitive systems are an integral aspect for everyday life activities which commonly deteriorate with age

Motor Skills and Their Foundational Role for Perceptual, Social, and Cognitive Development Klaus Libertus, Petra Hauf, 2017-05-18 Motor skills are a vital part of healthy development and are featured prominently both in physical examinations and in parents baby diaries It has been known for a long time that motor development is critical for children s understanding of the physical and social world Learning occurs through dynamic interactions and exchanges with the physical and the social world and consequently movements of eyes and head arms and legs and the entire body are a critical during learning At birth we start with relatively poorly developed motor skills but soon gain eye and head control learn to reach grasp sit and eventually to crawl and walk on our own The opportunities arising from each of these motor milestones are profound and open new and exciting possibilities for exploration and interactions and learning Consequently several theoretical accounts of child development suggest that growth in cognitive social and perceptual domains are influenced by infants own motor experiences Recently empirical studies have started to unravel the direct impact that motor skills may have on other domains of development This volume is part of this renewed interest and includes reviews of previous findings and recent empirical evidence for associations between the motor domain and other domains from leading researchers in the field of child development We hope that these articles will stimulate further research on this interesting question

The Cognitive Thalamus Yuri B. Saalman, Sabine Kastner, 2015-06-17

Cognitive processing is commonly conceptualized as being restricted to the cerebral cortex. Accordingly, electrophysiology, neuroimaging, and lesion studies involving human and animal subjects have almost exclusively focused on defining roles for cerebral cortical areas in cognition. Roles for the thalamus in cognition have been largely ignored despite the fact that the extensive connectivity between the thalamus and cerebral cortex gives rise to a closely coupled thalamo-cortical system. However, in recent years, growing interest in the thalamus as much more than a passive sensory structure, as well as methodological advances such as high-resolution functional magnetic resonance imaging of the thalamus and improved electrode targeting to subregions of thalamic nuclei using electrical stimulation and diffusion tensor imaging, have fostered research into thalamic contributions to cognition. Evidence suggests that behavioral context modulates processing in primary sensory or first-order thalamic nuclei, for example, the lateral geniculate and ventral posterior nuclei, allowing attentional filtering of incoming sensory information at an early stage of brain processing. Behavioral context appears to more strongly influence higher-order thalamic nuclei, for example, the pulvinar and mediodorsal nucleus, which receive major input from the cortex rather than the sensory periphery. Such higher-order thalamic nuclei have been shown to regulate information transmission in frontal and higher-order sensory cortex according to cognitive demands. This Research Topic aims to bring together neuroscientists who study different parts of the thalamus, particularly thalamic nuclei other than the primary sensory relays, and highlight the thalamic contributions to attention, memory, reward processing, decision making, and language. By doing so, an emphasis is also placed on neural mechanisms common to many, if not all, of these cognitive operations, such as thalamo-cortical interactions and modulatory influences from sources in the brainstem and basal ganglia. The overall view that emerges is that the thalamus is a vital node in brain networks supporting cognition.
