Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, at a pace of 3.0 to 3.5 miles per hour. The control group was instructed to continue with their current level of activity. The subjects were assessed at baseline and at 12 weeks. The walking program had a significant positive effect on the subjects' physical and psychological health. The walking program significantly improved the subjects' physical health, as measured by the 6-minute walk test, the 12-minute walk test, and the 400-meter walk test. The walking program also significantly improved the subjects' psychological health, as measured by the Beck Depression Inventory, the State-Trait Anxiety Inventory, and the Visual Analog Scale. The walking program had no significant effect on the subjects' weight, blood pressure, or cholesterol levels. The results of this study suggest that a 12-week, low-intensity, supervised walking program can improve the physical and psychological health of sedentary, middle-aged women.

QUESTION
A 60-year-old male with a long history of alcohol abuse presents with a 2-week history of increasing weakness and weight loss. He reports a recent episode of vomiting blood. Physical examination reveals a pale, thin man with a 10-lb weight loss over the past 3 months. Laboratory studies show a hemoglobin of 8 g/dL, hematocrit of 24%, and a mean corpuscular volume of 78 fL. A computed tomography scan of the abdomen shows a large, heterogeneous mass in the upper abdomen. What is the most likely diagnosis?

ANSWER
A. Gastric adenocarcinoma
B. Gastric lymphoma
C. Gastric leiomyosarcoma
D. Gastric neuroendocrine tumor
E. Gastric stromal tumor

EXPLANATION
The patient's history of alcohol abuse, weight loss, and vomiting blood are suggestive of a gastric malignancy. The physical examination findings of a pale, thin man with a 10-lb weight loss over the past 3 months are also consistent with a gastric malignancy. The laboratory studies show a hemoglobin of 8 g/dL, hematocrit of 24%, and a mean corpuscular volume of 78 fL, which are consistent with iron deficiency anemia. The computed tomography scan of the abdomen shows a large, heterogeneous mass in the upper abdomen, which is also consistent with a gastric malignancy. The most likely diagnosis is gastric adenocarcinoma.

Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised exercise program on the physical and psychological health of sedentary, middle-aged, obese women. The study was a randomized, controlled trial. The exercise group performed a 12-week, low-intensity, supervised exercise program, while the control group remained sedentary. The exercise group showed significant improvements in physical and psychological health compared to the control group. The exercise group showed significant improvements in physical health, including weight, body mass index, waist circumference, and blood pressure. The exercise group also showed significant improvements in psychological health, including self-esteem, body image, and quality of life. The exercise group showed no significant improvements in mood or anxiety. The control group showed no significant changes in physical or psychological health. The results of this study suggest that a 12-week, low-intensity, supervised exercise program can improve the physical and psychological health of sedentary, middle-aged, obese women.

QUESTION A 60-year-old male with a 10-year history of type 2 diabetes mellitus presents with a 2-week history of increasing fatigue, weight loss, and decreased appetite. He reports frequent urination and increased thirst. Physical examination reveals a BMI of 24 kg/m², tachycardia, and dry mucous membranes. Laboratory studies show a hemoglobin A1c of 10.5%, serum glucose of 250 mg/dL, and serum ketones of 2+. What is the most likely diagnosis?

ANSWER A. Type 1 diabetes mellitus
B. Type 2 diabetes mellitus
C. Gestational diabetes mellitus
D. Prediabetes

EXPLANATION The patient's symptoms and laboratory findings are consistent with type 2 diabetes mellitus. The presence of ketones in the urine suggests that the patient may have developed diabetic ketoacidosis (DKA), a complication of type 2 diabetes mellitus. The patient's HbA1c of 10.5% is significantly elevated, indicating poor glycemic control. The patient's weight loss and decreased appetite are also consistent with type 2 diabetes mellitus. The patient's tachycardia and dry mucous membranes are likely due to dehydration. The patient's BMI of 24 kg/m² is within the normal range. The patient's symptoms and laboratory findings are not consistent with type 1 diabetes mellitus, gestational diabetes mellitus, or prediabetes.

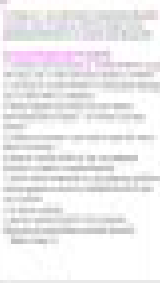

QUESTION
A 60-year-old male with a 20-year history of type 2 diabetes mellitus presents with a 2-week history of increasing fatigue, weight loss, and decreased appetite. He reports frequent urination and increased thirst. Physical examination reveals tachycardia, tachypnea, and a fruity odor to his breath. Laboratory studies show a serum glucose of 450 mg/dL, serum bicarbonate of 12 mEq/L, and a serum ketone level of 4+.

ANSWER
A. Insulin resistance
B. Type 1 diabetes mellitus
C. Type 2 diabetes mellitus
D. Type 3 diabetes mellitus
E. Type 4 diabetes mellitus

EXPLANATION
The patient's symptoms and physical findings are consistent with diabetic ketoacidosis (DKA), a complication of diabetes mellitus. The laboratory studies show hyperglycemia, metabolic acidosis, and ketonuria, which are characteristic of DKA. The most common cause of DKA is type 1 diabetes mellitus, but it can also occur in type 2 diabetes mellitus, especially in the setting of illness or stress. Type 3 and type 4 diabetes mellitus are rare forms of the disease.
