Eisenhauer, Christopher

Twelves, Marc E. Buyse, 2006 Phase I trials are a critical first step in the study of novel therapeutic approaches They follow years of development in the laboratory and precede Phase II and III trials where testing of the drug becomes more focused yet is conducted on a wider scale The primary goals of Phase I trials are to identify the recommended dose schedule and pharmacologic behaviour of new agents or new combinations of agents and to describe the adverse effects of treatment In

cancer therapeutics such studies have particular challenges In general because of the nature of the effects of treatment most studies are conducted in patients with advanced malignancy rather than in healthy volunteers Furthermore the endpoints of these trials are usually measures of adverse effects but increasingly investigators are interested in assessment of the effects of new drugs on their molecular target These factors render the design conduct analysis and ethical aspects of Phase I cancer clinical trials unique This book provides a practical guide to Phase I cancer trials and is appropriate for oncology trainees or specialists interested in understanding cancer drug development Topics covered include preclinical requirements needed for first in man investigation of new agents principles and statistical design ethical considerations of Phase I studies pharmacokinetics pharmacodynamics and studies in special populations Practical information on protocol development study activation and conduct as well as how to write reports of the results are incorporated Numerous appendices offer document templates to use in Phase I study development and examples from actual Phase I trials are interspersed throughout making this a true hands on guide In an exciting time in cancer research as the number and type of new potential anti cancer drugs is increasing dramatically this book provides much needed information on the first stage in getting a drug approved
