Impact Evaluation using the Translational Science Benefits Model Framework in the National Center for Advancing

Translational Science Clinical and Translational Science Award Program Pamela Davidson, Joe Hunt, Douglas

Luke, Anna La Manna, 2025-11-10 Knowledge translation is a critical activity that helps transform research results into new practices and policies that benefit health and society Similar to other countries the US has initiated a translational science

research program in clinical research and public health In the US the National Institutes of Health NIH and the National Center for Advancing Translational Science NCATS have addressed this challenge through the Clinical and Translational Science Award CTSA Program The charge of the CTSA Program is to transform the organization and infrastructure of the academic research enterprise to facilitate the movement of discoveries from clinical science to the bedside and community Documenting the results of these efforts is a necessary component to assess outcomes health and social impacts and support continuous improvement In the CTSA program the 60 CTSA hubs primarily located at academic health sciences research institutes across the nation are just starting to systematically measure and evaluate the impacts of their activities One example of tracking and assessing impact is the Translational Science Benefits Model TSBM introduced in 2018 which is one of the first frameworks for standardized documentation and dissemination of data on outcomes and impacts of translational science and translational research Additionally this Research Topic will explore and compare models and measurement tools used to assess the impact of translational science research internationally This Research Topic will highlight the use of the Translational Science Benefits Model TSBM and other impact evaluation models applied by investigators across a wide spectrum of medical and public health areas including CTSA hubs community international partners and others Although translational science is still in its infancy much work is being conducted nationally and internationally to integrate impact evaluation on medical and public health practice the economy and health policy In terms of a prevention orientation the TSBM can be used to track program development implementation and impacts on preventing and addressing disease The TSBM framework is also useful for changing the culture of academic research settings to place more value on health and social impacts as well as providing training opportunities for early career investigators on how to design for impact at the beginning of programmatic research The TSBM framework has been successfully deployed within the context of the CTSA Program Sharing successful applications of the TSBM across a wider range of research dissemination and implementation is needed to fully understand its strengths and limitations to refine and improve it further and to study its application in a variety of contexts Hence this model has the potential to become a standard for systematic comparable reporting of translational science impact on health and societal benefits We aim to identify similar impact models deployed within international research settings The scope of this Research Topic includes advances in data collection methodology analysis and results from the application of the TSBM in the CTSA Program as well as with community and international partners Specific themes might include but are not limited to Development and use of quantitative metrics and qualitative measures using the TSBM TSBM as an educational intervention to train junior investigators on impact in translational science Longitudinal evaluation to show potential and demonstrated impact in specific research areas e g software development public health policy change Integrating social determinants of health disparities and equity in impact evaluation Application of TSBM results to improve operations and translational science in core areas of CTSA hubs TSBM is used to deliver new

programs applications and community engagement to build cases in the 4 domains Examples of TSBM used to track research findings into public health practice Examples of international application of the TSBM and other impact models **Cancer Stem Cells: Emerging Concepts and Future Perspectives in Translational Oncology** Sadegh Babashah,2015-11-12

Stem Cells and Cancer Sadhan Majumder,2009-06-07 Cancer is a primary cause of human mortality worldwide Despite decades of basic and clinical research the outcome for most cancer patients is still dismal Some stumbling blocks to developing effective therapy include the heterogeneity of cancer tissues the lack of knowledge about the critical molecular mechanisms in cancer tissues which are typically aberrant compared with mechanisms in normal tissue and the lack of good mechanism based therapeutic approaches The recent findings that most cancers contain a small fraction of self renewing differentiation blocked stem cell like cells cancer stem cells and that it is these cells and not the major bulk of the tissue that are the root cause for cancer initiation and metastasis have also highlighted the need to change our approach to cancer therapy The objectives of this book therefore would be to impart up to date information about the role of stem cells in the development of normal and cancerous tissue the mechanisms that differentiate normal from cancerous functions and the use of these findings in developing mechanism based therapies

Cancer Stem Cells in Solid Tumors Alison L. Allan,2011-08-12 The cancer stem cell hypothesis postulates that cancer arises from a subpopulation of tumor initiating cells or cancer stem cells CSCs While the idea of cancer stem cells has been around for more than a hundred years evidence from the fields of hematology and cancer biology has now demonstrated the critical role of stem cells in hematological malignancies and suggested that these same mechanisms are also central to the initiation progression and treatment of solid cancers Clinical and experimental studies have shown that CSCs exhibit many

classical properties of normal stem cells including a high self renewal capacity and the ability to generate heterogeneous lineages the requirement for a specific niche microenvironment to grow and an increased capacity for self protection against harsh environments toxins and drugs Cancer Stem Cells in Solid Tumors represents a detailed overview of cancer stem cells and their role in solid cancers Comprised of 24 chapters this volume will provide readers with a comprehensive understanding of this important and evolving field Topics covered include Introduction of the CSC hypothesis Historical perspectives and the contributing lessons from leukemia Current knowledge regarding the identification and role of CSCs in various forms of solid cancer including breast brain colorectal pancreatic prostate melanoma lung ovarian hepatocellular and head and neck cancer Molecular pathways involved in driving CSC function with a particular focus on the novel convergence of embryonic and tumorigenic signaling pathways In vitro and in vivo assays model systems and imaging modalities for studying CSCs The clinical importance of CSCs for cancer management and treatment including important implications for prognosis prediction and treatment resistance Consideration of the controversy surrounding the CSC hypothesis and important unanswered questions in this field This collective work was written by a group of prominent international experts in cancer biology oncology and or stem cell biology It will serve as a valuable resource for established researchers professors health care professionals and students in the medical and scientific community who are investigating stem cells and or oncology
