Reconfigurable Active and Passive Planar Antennas for Wireless Communication Systems Shibani Kishen Koul, Rajesh K. Singh, 2022-10-14 This book presents state of the art trends in reconfigurable active and passive planar antennas and their applications in wireless communication systems operating in

the frequency band 5.6 GHz. Due to various key features such as multifunction antenna design, compactness, planar nature, and low cost, these technologies are becoming popular for current and future wireless applications. This book discusses different novel antenna designs and their working principles in detail. The modern and future wireless systems require wideband antennas to accommodate various channels in a single band or in separate bands. The carrier aggregation (CA) has been introduced in the modern wireless systems such as LTE-advanced systems and 5G/6G. In CA, a device can use several channels for transmission and reception. The used channels can exist in the same frequency band (intra-band CA) or in distinct bands (inter-band CA). To accommodate more channels, more bandwidth is required within the operating band. For portable devices, circularly polarized (CP) antennas are more advantageous over linearly polarized antennas since in CP antennas there is low risk of misalignment and hence encountering interference. Circularly polarized antenna also provides higher link reliability for the portable devices. To provide high data rates, more bandwidth is needed to accommodate more channels. Various multifunction compact and wideband antennas for plethora of applications are addressed in detail in this book. The scope of developing reconfigurable active antennas for application in beam switching, beam steering, wireless charging, security systems etc. is described. This book concludes by giving glimpses of antenna requirements for future wireless communication systems.

Advanced Integrated Communication Microsystems Joy Laskar, Sudipto Chakraborty, Anh-Vu Pham, Manos M. Tantziris, 2009-02-10. Learn the fundamentals of integrated communication microsystems. Advanced communication microsystems, the latest technology to emerge in the semiconductor sector after microprocessors, require integration of diverse signal processing blocks in a power efficient and cost effective manner. Typically, these systems include data acquisition, data processing, telemetry, and power management. The overall development is a synergy among system, circuit, and component level designs with a strong emphasis on integration. This book is targeted at students, researchers, and industry practitioners in the semiconductor area who require a thorough understanding of integrated communication microsystems from a developer's perspective. The book thoroughly and carefully explores fundamental requirements of communication microsystems, system design and considerations for wired and wireless communication microsystems, advanced block level design techniques for communication microsystems, integration of communication systems in a hybrid environment, packaging considerations, power and form factor trade-offs in building integrated microsystems. *Advanced Integrated Communication Microsystems* is an ideal textbook for advanced undergraduate and graduate courses. It also serves as a valuable reference for researchers and practitioners in circuit design for telecommunications and related fields.

Planar Antenna Arrays Using Feed Networks with Nonradiative Dielectric (NRD) Waveguide Ulf Schmid, 2011-11-04. This thesis deals with the investigation and development of low profile low loss antennas with emphasis on reduced cost implementations for different communication and radar applications in the microwave and millimeter wave region. All antennas investigated in this work are implemented in the K band 18 GHz–26.5 GHz as for this frequency range measurement

facilities and power amplifiers were readily available but actually they lend themselves for applications in the mm wave range where the low loss characteristic of the NRD guide is even more pronounced
