Designing an Internet David D. Clark, 2018-10-30 Why the Internet was designed to be the way it is and how it could be different now and in the future How do you design an internet The architecture of the current Internet is the product of basic design decisions made early in its history What would an internet look like if it were designed today from the ground up In this book MIT computer scientist David Clark explains how the Internet is actually put together what requirements it was designed to meet and why different design decisions would create different internets He does not take today's Internet as a given but tries to learn from it and from alternative proposals for what an internet might be in order to draw some general conclusions about network architecture Clark discusses the history of the Internet and how a range of potentially conflicting requirements including longevity security availability economic viability management and meeting the needs of society shaped its character He addresses both the technical aspects of the Internet and its broader social and economic contexts He describes basic design approaches and explains in terms accessible to nonspecialists how networks are designed to carry out their functions An appendix offers a more technical discussion of network functions for readers who want the details He considers a range of alternative proposals for how to design an internet examines in detail the key requirements a successful design must meet and then imagines how to design a future internet from scratch It's not that we should expect anyone to do this but perhaps by conceiving a better future we can push toward it "Hands on ...":
