System-Level Design of GPU-Based Embedded Systems Arian Maghazeh, 2018-12-07 Modern embedded systems deploy several hardware accelerators in a heterogeneous manner to deliver high performance computing Among such devices graphics processing units GPUs have earned a prominent position by virtue of their immense computing power However a system design that relies on sheer throughput of GPUs is often incapable of satisfying the strict power and time related constraints faced by the embedded systems This thesis presents several system level software techniques to optimize the design of GPU based embedded systems under various graphics and non graphics applications As compared to the conventional application level optimizations the system wide view of our proposed techniques brings about several advantages First it allows for fully incorporating the limitations and requirements of the various system parts in the design process Second it can unveil optimization opportunities through exposing the information flow between the processing components Third the techniques are generally applicable to a wide range of applications with similar characteristics In addition multiple system level techniques can be combined together or with application level techniques to further improve the performance We begin by studying some of the unique attributes of GPU based embedded systems and discussing several factors that distinguish the design of these systems from that of the conventional high end GPU based systems We then proceed to develop two techniques that address an important challenge in the design of GPU based embedded systems from different perspectives The challenge arises from the fact that GPUs require a large amount of workload to be present at runtime in order to deliver a high throughput However for some embedded applications collecting large batches of input data requires an unacceptable waiting time prompting a trade off between throughput and latency We also develop an optimization technique for GPU based applications to address the memory bottleneck issue by utilizing the GPU L2 cache to shorten data access time Moreover in the area of graphics applications and in particular with a focus on mobile games we propose a power management scheme to reduce the GPU power consumption by dynamically adjusting the display resolution

while considering the user's visual perception at various resolutions. We also discuss the collective impact of the proposed techniques in tackling the design challenges of emerging complex systems. The proposed techniques are assessed by real-life experimentations on GPU-based hardware platforms which demonstrate the superior performance of our approaches as compared to the state-of-the-art techniques.

Hands-On GPU Programming with Python and CUDA Dr. Brian Tuomanen, 2018-11-27 Build real world applications with Python 2.7, CUDA 9 and CUDA 10. We suggest the use of Python 2.7 over Python 3.x since Python 2.7 has stable support across all the libraries we use in this book. Key Features: Expand your background in GPU programming. PyCUDA, scikit-cuda and Nsight. Effectively use CUDA libraries such as cuBLAS, cuFFT and cuSolver. Apply GPU programming to modern data science applications. Book Description: Hands On GPU Programming with Python and CUDA hits the ground running. You'll start by learning how to apply Amdahl's Law, use a code profiler to identify bottlenecks in your Python code and set up an appropriate GPU programming environment. You'll then see how to query the GPU's features and copy arrays of data to and from the GPU's own memory. As you make your way through the book, you'll launch code directly onto the GPU and write full-blown GPU kernels and device functions in CUDA C. You'll get to grips with profiling GPU code effectively and fully test and debug your code using Nsight IDE. Next, you'll explore some of the more well-known NVIDIA libraries such as cuFFT and cuBLAS. With a solid background in place, you will now apply your new-found knowledge to develop your very own GPU-based deep neural network from scratch. You'll then explore advanced topics such as warp shuffling, dynamic parallelism and PTX assembly. In the final chapter, you'll see some topics and applications related to GPU programming that you may wish to pursue, including AI graphics and blockchain. By the end of this book, you will be able to apply GPU programming to problems related to data science and high performance computing. What you will learn: Launch GPU code directly from Python. Write effective and efficient GPU kernels and device functions. Use libraries such as cuFFT, cuBLAS and cuSolver. Debug and profile your code with Nsight and Visual Profiler. Apply GPU programming to data science problems. Build a GPU-based deep neural network from scratch. Explore advanced GPU hardware features such as warp shuffling.
