Oxygenases And Model Systems Catalysis By Metal Complexes Volume 19:

Oxygenases and Model Systems T. Funabiki, 2012-12-06 Oxygenases have been the subject of much study and are of great interest and application Biomimetic chemistry of oxygenases has yielded clarification of enzyme structures and reaction mechanisms and has also led to the development of synthetic oxygenation processes This volume contains 8 chapters written by leading researchers which together present an overview of di and mono oxygenases and their model systems from the point of view of functions structures and mechanisms An up to date clarification of structures around active centres of heme and nonheme oxygenases is given with reference to the design of model complexes Various contributions also discuss in detail the formation structure and reactivity of metal oxygen and metal substrate species in both enzyme and model systems The contents of the volume address the interface between bioinorganic chemistry and homogeneous catalysis and contains much to emphasize the importance of catalytic studies in bio and biomimetic chemistry Audience Research chemists interested in the use of oxygenases in catalysis

Advances in Catalytic Activation of Dioxygen by Metal Complexes László I. Simándi, 2006-04-11 The subject of dioxygen activation and homogeneous catalytic oxidation by metal complexes has been in the focus of attention over the last 20 years The widespread interest is illustrated by its recurring presence among the sessions and subject areas of important international conferences on various aspects of bioinorganic and coordination chemistry as well as catalysis The most prominent examples are ICCO ICBIC EUROBIC ISHC and of course the ADHOC series of meetings focusing on the subject itself Similarly the number of original and review papers devoted to various aspects of dioxygen activation are on the rise This trend is due obviously to the relevance of catalytic oxidation to biological processes such as dioxygen transport and the action of oxygenase and oxidase enzymes related to metabolism The structural and functional modeling of metalloenzymes particularly of those containing iron and copper by means of low molecular complexes of iron copper ruthenium cobalt manganese etc have provided a wealth of indirect information helping to understand how the active centers of metalloenzymes may operate The knowledge gained from the study of metalloenzyme models is also applicable in the design of transition metal complexes as catalysts for specific reactions This approach has come to be known as biomimetic or bioinspired catalysis and continues to be a fruitful and expanding area of research

Heterocycles from Transition Metal Catalysis András Kotschy, Géza Timári, 2005-09-30 Heterocycles from Transition Metal Catalysis Formation and Functionalization provides a concise summary of the prominent role of late transition metal palladium nickel copper catalysed processes in the synthesis and functionalization of heterocyclic systems It gives an introduction to catalytic transformations an overview of the most important reaction types and presents synthetically useful catalytic processes classified by the target system and the type of transformation The book provides a representative selection of transition metal catalysed reactions transformations that are relevant in heterocyclic chemistry In this way the authors present a useful resource for members of the academic community looking for a textbook as well as industrial

chemists in search of a reference book This book will be an invaluable resource for synthetic chemists medicinal chemists and those more generally interested in applied catalysis *Advances in Inorganic Chemistry*, 2004-05-06 *Advances in Inorganic Chemistry* presents timely and informative summaries of the current progress in a variety of subject areas within inorganic chemistry ranging from bio inorganic to solid state studies This acclaimed serial features reviews written by experts in the area and is an indispensable reference to advanced researchers Each volume of *Advances in Inorganic Chemistry* contains an index and each chapter is fully referenced Comprehensive reviews written by leading experts in the field An indispensable reference to advanced researchers Includes 7 contributions covering important advances in inorganic chemistry *Activation and Catalytic Reactions of Saturated Hydrocarbons in the Presence of Metal Complexes* A.E. Shilov, Georgiy B. Shul'pin, 2006-04-11 Chemistry is the science about breaking and forming of bonds between atoms One of the most important processes for organic chemistry is breaking bonds C H as well as C C in various compounds and primarily in hydrocarbons Among hydrocarbons saturated hydrocarbons alkanes methane ethane propane hexane etc are especially attractive as substrates for chemical transformations This is because on the one hand alkanes are the main constituents of oil and natural gas and consequently are the principal feedstocks for chemical industry On the other hand these substances are known to be the less reactive organic compounds Saturated hydrocarbons may be called the noble gases of organic chemistry and if so the first representative of their family methane may be compared with extremely inert helium As in all comparisons this parallel between noble gases and alkanes is not fully accurate Indeed the transformations of alkanes including methane have been known for a long time These reactions involve the interaction with molecular oxygen from air burning the main source of energy as well as some mutual interconversions of saturated and unsaturated hydrocarbons However all these transformations occur at elevated temperatures higher than 300 500 C and are usually characterized by a lack of selectivity The conversion of alkanes into carbon dioxide and water during burning is an extremely valuable process but not from a chemist viewpoint **Aqueous Organometallic Catalysis** Ferenc Joó, 2006-04-11 Over the past 20 years aqueous organometallic catalysis has found applications in small scale organic synthesis in the laboratory as well as in the industrial production of chemicals with a combined output close to one million tons per year Aqueous organic two phase reactions allow easy product catalyst separation and full catalyst recovery which mean clear benefits not only in economic but also in environmental and green chemistry contexts Instead of putting together a series of expert reviews of specialized fields this book attempts to give a comprehensive yet comprehensible description of the various catalytic transformations in aqueous systems as seen by an author who has been working on aqueous organometallic catalysis since its origin Emphasis is put on the discussion of differences between related non aqueous and aqueous processes due to the presence of water The book will be of interest to experts and students working in catalysis inorganic chemistry or organic synthesis and may serve as a basis for advanced courses *Catalytic Reductive Carbonylation of Organic Nitro Compounds* S. Cenini, F. Ragaini, 2013-04-17

About eight years ago the catalytic carbonylation of organic nitro compounds was a research field developed enough to justify a rather long review on this subject. Now we feel that the scientific results and new achievements in this field very important even from an industrial point of view require a book in order to be adequately presented. The competition between the catalytic carbonylation of organic nitro compounds and other chemical routes for the synthesis of a variety of organic compounds has not yet come to an end but many progresses have been done in the former field. We also like to emphasize that this type of research does not only involve relevant industrial problems to be solved but it opens a research field where the academic interests mechanism of the reactions isolation of the intermediates in the catalytic cycles synthesis of model compounds and so on can find a lot of opportunities.

Catalyst Separation, Recovery and Recycling David J. Cole-Hamilton, Robert P. Tooze, 2006-10-12 This book looks at new ways of tackling the problem of separating reaction products from homogeneous catalytic solutions. The new processes involve low leaching supported catalysts soluble supports such as polymers and dendrimers and unusual solvents such as water fluorinated organics ionic liquids and supercritical fluids. The advantages of the different possibilities are discussed alongside suggestions for further research that will be required for commercialisation. Unlike other books in addition to the chemistry involved the book looks at the process design that would be required to bring the new approaches to fruition. Comparisons are given with existing processes that have already been successfully applied and examples are given where these approaches are not suitable. The book includes New processes for the separation of products from solutions containing homogeneous catalysts Catalysts on insoluble or soluble supports fixed bed catalysts continuous flow or ultrafiltration Biphasic systems water organic fluorinated organic ionic liquid organic supercritical fluids monophasic or biphasic with water organic or ionic liquid Comparisons with current processes involving atmospheric or low temperature distillation Consideration of Chemistry and Process Design Advantages and disadvantages of each process exposed Consideration of what else is need for commercialisation

Rhodium Catalyzed Hydroformylation Piet W.N.M. van Leeuwen, Carmen Claver, 2006-04-11 In the last decade there have been numerous advances in the area of rhodium catalyzed hydroformylation such as highly selective catalysts of industrial importance new insights into mechanisms of the reaction very selective asymmetric catalysts in situ characterization and application to organic synthesis. The views on hydroformylation which still prevail in the current textbooks have become obsolete in several respects. Therefore it was felt timely to collect these advances in a book. The book contains a series of chapters discussing several rhodium systems arranged according to ligand type including asymmetric ligands a chapter on applications in organic chemistry a chapter on modern processes and separations and a chapter on catalyst preparation and laboratory techniques. This book concentrates on highlights rather than a concise review mentioning all articles in just one line. The book aims at an audience of advanced students experts in the field and scientists from related fields. The didactic approach also makes it useful as a guide for an advanced course.

Organometallic Modeling of the Hydrodesulfurization and

Hydrodenitrogenation Reactions Robert A. Sánchez-Delgado, 2002-04-30 The fields of hydrodesulfurization HDS and hydrodenitrogenation HDN continue to attract the attention of researchers in the various disciplines connected to these fascinating problems that represent two of the key outstanding chemical challenges for the petroleum refining industry in view of their very strong environmental and commercial implications One area that has flourished impressively over the last 15 years is the organometallic chemistry of thiophenes and other related sulfur containing molecules This has become a powerful method for modeling numerous surface species and reactions implicated in HDS schemes and nowadays it represents an attractive complement to the standard procedures of surface chemistry and heterogeneous catalysis for understanding the complex reaction mechanisms involved in this process Similar developments have begun to appear in connection with HDN mechanisms although in a much more modest scale and depth Some years ago when encouraged by Prof B R James this book was planned several excellent reviews and monographs treating different aspects of HDS were already available including some on the subject of organometallic models However it seemed appropriate to try to summarize the most striking features of this chemistry in an updated and systematic way and inasmuch as possible in connection with the common knowledge and beliefs of the mechanisms of heterogeneous HDS catalysis Hopefully this attempt to build some conceptual bridges between these two traditionally separated areas of chemistry has met with some success **Applied Chemistry and Chemical Engineering, Volume 4** A.
