Title:

Recrystallization of Benzil

Performed: September 28th, 2018

Submitted: October 8th, 2018

Abstract:

- In organic chemistry, the most important method of purifying a solid is crystallization. This experiment involved performing the steps of crystallization using the solid Benzil with methanol. The goal of this experiment was to purify the rudimentary compound of Benzil which will be done using a laboratory technique known as recrystallization. The seven steps of crystallization include choosing a solvent, dissolving the solute, decolorizing the solution, filtration, crystallization, collecting and washing the crystals, and drying the crystals. In this technique crystals are dissolved in methanol as the solvent, which is then filtered and cooled until the crystals re-solidify. The crystals were purified with a percent recovery. The percentage yield was 0.88 g.

Objective:

- To use the technique of recrystallization, to recrystallize the impure sample of Benzil using methanol as the solvent.

Introduction:

Recrystallization is the most important method for the purification of solid organic compounds. A crystalline organic substance is made up of a three-dimensional array of molecules held together primarily by van der Waals forces. The products of chemical reactions can be impure. Purification of your products must be performed to remove by-products and impurities. Liquids are customarily purified by distillation, while solids are purified by recrystallization (sometimes called simply "crystallization"). Recrystallization is a method of purifying a solid. There are two types of impurities: those more soluble in a given solvent than the main component and those less soluble. The technique used to purify non-volatile solids. It depends on the solubility of a compound in a solvent where it is dissolved and the pure compound is regenerated in crystal form. Solubility is crucial. There are three stages of solubility: 1) collision between solvent molecules and solute molecules 2) dissociation, where the solute molecules leave the bulk crystal lattice, and 3) solvation, where the solute is surrounded by the solvent molecules. Most purifications in the laboratory involve dissolving the
