Proceedings of the Vortex Workshop Yiqian Wang, Chaoqun Liu, Yan Li, 2024-11-15 Written by the leading experts in the field this book results from Vortex Workshop 2023 which took place in San Diego the USA on December 11-13 Vortex is ubiquitous in the universe such as tornado hurricane airplane tip vortex and even star vortex in Galaxy Vortices are also building blocks muscles and sinews of turbulent flows A vortex is intuitively recognized as a rotational swirling motion of fluids but until recently had no rigidly mathematical definition In 1858 Helmholtz first defined vortex as composed of so called vortex filaments which are infinitesimal vorticity tubes which is called as the first generation of vortex definition and identification or G1 Although G1 has been accepted by the fluid dynamics community and almost all textbooks for over a century we can find many immediate counterexamples for example in the laminar boundary layer where the vorticity shear is very large near the wall but not rotation no vortex exists To solve these contradictions many vortex criteria methods have been developed during the past 4 decades More popular methods are

represented by the Q criteria methods These methods have achieved part of success in vortex identification which are called the second generation of vortex identification or G2 However G2 has several critical drawbacks First they are all scalars which have no rotation axis directions but vortex is a vector It is hard or impossible to use a scalar to represent a vector Second like vorticity these criteria methods are all contaminated by shear in different degrees Third they are all very sensitive on threshold selections The recently developed Liutex is called the third generation of vortex definition and identification or G3 which is a uniquely defined vector
