neuropsychologists and students in clinical neuropsychology must increasingly cross disciplinary boundaries to understand and appreciate the neuroanatomical, neurophysiological, and neuropharmacological bases of cognition and behavior. Current cognitive theory in many different domains of functioning and the nature and tools of clinical assessment. Although the cognitive functions and abilities of interest are often the same, each of these fields has grappled with them from sometimes very different perspectives. Terminology is often specific to a particular discipline, and approaches, methods, and goals or outcomes of study or investigation are usually very different. This book poises itself to provide a largely missing link between traditional approaches to assessment and the growing area of cognitive neuropsychology. Historically, neuropsychology had as its central core the consideration of evidence from clinical cases. It was the early work of neurologists such as Broca, Wernicke, Hughlings Jackson, and Liepmann who evaluated and described the behavioral correlates of prescribed lesions in individual patients and focused investigation on the lateralization and localization of cognitive abilities in humans. An outgrowth of those approaches was the systematic development of experimental tasks that could be used to elucidate the nature of cognitive changes in individuals with well-described brain lesions.

The Causes of High and Low Reading Achievement Ronald P. Carver, 2000-02-01 This book describes all of the important factors that cause some students to have low reading achievement and others to have high reading achievement. It concentrates on the main factors that influence how much a student gains in reading achievement during a year of school or a calendar year. An attempt is made to answer the following questions: what can educators do to increase reading achievement and what is beyond their influence? The author is directly concerned with achievement associated with normal or typical reading. The focus of the book is on things teachers can do during an entire school year that are likely to improve the reading level and reading rate of students, which in turn will increase their reading achievement. This effort to specify the most important causes of high and low reading achievement represents an integration of two disciplines of scientific psychology: experimental psychology and psychometrics. A glossary at the end of the book contains definitions of terms and concepts. Helpful appendices explain reading theory, the three laws of reading theory, and the equations that can be used to predict the accuracy of reading comprehension, provide conversions among units of reading rate, and list the numbered equations presented in the book.
