Eco-Sonic Media Jacob Smith, 2015-06-05 The negative environmental effects of media culture are not often acknowledged the fuel required to keep huge server farms in operation landfills full of high tech junk and the extraction of rare minerals for devices reliant on them are just some of the hidden costs

of the contemporary mediascape Eco Sonic Media brings an ecological critique to the history of sound media technologies in order to amplify the environmental undertones in sound studies and turn up the audio in discussions of greening the media By looking at early and neglected forms of sound technology Jacob Smith seeks to create a revisionist ecologically aware history of sound media Delving into the history of pre electronic media like hand cranked gramophones comparatively eco friendly media artifacts such as the shellac discs that preceded the use of petroleum based vinyl early forms of portable technology like divining rods and even the use of songbirds as domestic music machines Smith builds a scaffolding of historical case studies to demonstrate how green media archaeology can make sound studies vibrate at an ecological frequency while opening the ears of eco criticism Throughout this eye opening and timely book he makes readers more aware of the costs and consequences of their personal media consumption by prompting comparisons with non digital non electronic technologies and by offering different ways in which sound media can become eco sonic media In the process he forges interdisciplinary connections opens new avenues of research and poses fresh theoretical questions for scholars and students of media sound studies and contemporary environmental history

Learning the Virtual Life Peter Pericles Trifonas, 2012-04-23 Learning the Virtual Life offers ways to consider the local and global effects of digital media on educational environments as well as the cultural transformations of how we now define learning and literacy Multi-scale Perspectives on Building Heritage Conservation and Sustainable Cities Graziella Bernardo, Luis Manuel Palmero

Iglesias, 2025-07-26 The book investigates modern architecture as an architectural and cultural heritage highlighting with a holistic view of sustainability the aspects that have led to epochal changes in the way cities are designed and lived Currently many of these buildings spread throughout the world are not recognized as architectural heritage due to the lack of knowledge of innovations in design approaches materials and building technologies and their social and economic implications in the development of contemporary cities The main objective is to raise awareness promote revalue and preserve the building heritage of the last century through their maintenance and adaptive reuse to the changing needs of the community according to new models of the circular economy and the use of digital technologies The topics treated with multidisciplinary approaches reconstruct a recent past of which memory has been lost and highlight how the heritage built is a resource of incalculable value that can greatly contribute to the sustainability of cities Computational Simulation in Architectural and Environmental Acoustics Tetsuya Sakuma, Shinichi Sakamoto, Toru Otsuru, 2014-08-05

This book reviews a variety of methods for wave based acoustic simulation and recent applications to architectural and environmental acoustic problems Following an introduction providing an overview of computational simulation of sound environment the book is in two parts four chapters on methods and four chapters on applications The first part explains the fundamentals and advanced techniques for three popular methods namely the finite difference time domain method the finite element method and the boundary element method as well as alternative time domain methods The second part demonstrates various applications to

room acoustics simulation noise propagation simulation acoustic property simulation for building components and auralization This book is a valuable reference that covers the state of the art in computational simulation for architectural and environmental acoustics

Smart Wireless Acoustic Sensor Network Design for Noise Monitoring in Smart Cities Rosa Ma Alsina-Pagès, Patrizia Bellucci, Giovanni Zambon, 2021-01-15 The Environmental Noise Directive END requires that a five year updating of noise maps is carried out to check and report on the changes that have occurred during the reference period The updating process is usually achieved using a standardized approach consisting of collecting and processing information through acoustic models to produce the updated noise maps This procedure is time consuming and costly and has a significant impact on the financial statement of the authorities responsible for providing the maps Furthermore the END requires that easy to read noise maps are made available to the public to provide information on noise levels and the subsequent actions to be undertaken by local and central authorities to reduce noise impacts In order to update the noise maps more easily and in a more effective way it is convenient to design an integrated system incorporating real time noise measurement and signal processing to identify and analyze the noise sources present in the mapping area e g road traffic noise leisure noise etc as well as to automatically generate and present the corresponding noise maps This wireless acoustic sensor network design requires transversal knowledge from accurate hardware design for acoustic sensors to network structure design and management of the information with signal processing to identify the origin of the measured noise and graphical user interface application design to present the results to end users This book is collection in which several views of methodology and technologies required for the development of an efficient wireless acoustic sensor network from the first stages of its design to the tests conducted during deployment its final performance and possible subsequent implications for authorities in terms of the definition of policies Contributions include several LIFE and H2020 projects aimed at the design and implementation of intelligent acoustic sensor networks with a focus on the publication of good practices for the design and deployment of intelligent networks in other locations
