Linear Response Theory Giuseppe De Nittis, Max Lein, 2017-06-21 This book presents a modern and systematic approach to Linear Response Theory LRT by combining analytic and algebraic ideas LRT is a tool to study systems that are driven out of equilibrium by external perturbations In particular the reader is provided with a new and robust tool to implement LRT for a wide array of systems The proposed formalism in fact applies to periodic and random systems in the discrete and the continuum After a short introduction describing the structure of the book its aim and motivation the basic elements of the theory are presented in chapter 2 The mathematical framework of the theory is outlined in chapters 3 5 the relevant von Neumann algebras noncommutative L_p and Sobolev spaces are introduced their construction is then made explicit for common physical systems the notion of isospectral perturbations and the associated dynamics are studied Chapter 6 is dedicated to the main results proofs of the Kubo and Kubo-Streda formulas The book closes with a chapter about possible future developments and applications of the theory to periodic light conductors The book addresses a wide audience of mathematical physicists focusing on the conceptual aspects rather than technical details and making algebraic methods accessible to analysts
