Network Flows Theory Algorithms And Applications Ravindra K Ahuja:

Network Flows Ravindra K. Ahuja, Thomas L. Magnanti, James B. Orlin, 1993 Among all topics covered in operations research network flows theory offers the best context to illustrate the basic concepts of optimization This book provides an integrative view of the theory algorithms and applications of network flows In order for their presentation to be more intuitive and accessible to a wider audience the authors prefer to adopt a network or graphical viewpoint rather than relying on a linear programming approach

Multicommodity and Generalized Flow Algorithms Jeffrey David Oldham, 1999 Abstract We present several simple practical and fast algorithms for linear programs concentrating on network flow problems Since the late 1980s researchers developed different combinatorial approximation algorithms for fractional packing problems obtaining the fastest theoretical running times to solve multicommodity minimum cost and concurrent flow problems A direct implementation of these multicommodity flow algorithms was several orders of magnitude slower than solving these problems using a commercial linear programming solver Through experimentation we determined which theoretically equivalent constructs are experimentally efficient Guided by theory we designed and implemented practical improvements while maintaining the same worst case complexity bounds The resulting algorithms solve problems orders of magnitude faster than commercial linear programming solvers and problems an order of magnitude larger We also present simple combinatorial algorithms for generalized flow problems These problems generalize ordinary network flow problems by specifying a flow multiplier μ_a for each arc a Using multipliers permit a flow problem to model transforming one type into another e.g. currency exchange and modification of the amount of flow e.g. water evaporation from canals or accrual of interest in bank accounts First we show the generalized shortest paths problem can be solved using existing network flow ideas i.e. by combining the Bellman Ford Moore shortest path framework and Megiddo's parametric search Second we combine this algorithm with fractional packing frameworks to yield the first polynomial time combinatorial approximation algorithms for the generalized versions of the nonnegative cost minimum cost flow concurrent flow multicommodity maximum flow and multicommodity nonnegative cost minimum cost flow problems These algorithms show that generalized concurrent flow and multicommodity maximum flow have strongly polynomial approximation algorithms
