Federal Energy Regulatory Commission,2004-07 **Analytic Research Foundations for the Next-Generation Electric Grid** National Academies of Sciences, Engineering, and Medicine,Division on Engineering and Physical Sciences,Board on Mathematical Sciences and Their Applications,Committee on Analytical Research Foundations for the Next-Generation Electric Grid,2016-05-15 Electricity is the lifeblood of modern society and for the vast majority of people that electricity is obtained

from large interconnected power grids. However, the grid that was developed in the 20th century and the incremental improvements made since then, including its underlying analytic foundations, is no longer adequate to completely meet the needs of the 21st century. The next generation electric grid must be more flexible and resilient. While fossil fuels will have their place for decades to come, the grid of the future will need to accommodate a wider mix of more intermittent generating sources such as wind and distributed solar photovoltaics. Achieving this grid of the future will require effort on several fronts. There is a need for continued shorter term engineering research and development building on the existing analytic foundations for the grid. But there is also a need for more fundamental research to expand these analytic foundations. Analytic Research Foundations for the Next Generation Electric Grid provide guidance on the longer term critical areas for research in mathematical and computational sciences that is needed for the next generation grid. It offers recommendations that are designed to help direct future research as the grid evolves and to give the nation's research and development infrastructure the tools it needs to effectively develop, test, and use this research. Terrorism and the Electric Power Delivery System National Research Council, Division on Engineering and Physical Sciences, Board on Energy and Environmental Systems, Committee on Enhancing the Robustness and Resilience of Future Electrical Transmission and Distribution in the United States to Terrorist Attack, 2012-11-25 The electric power delivery system that carries electricity from large central generators to customers could be severely damaged by a small number of well informed attackers The system is inherently vulnerable because transmission lines may span hundreds of miles and many key facilities are unguarded This vulnerability is exacerbated by the fact that the power grid most of which was originally designed to meet the needs of individual vertically integrated utilities is being used to move power between regions to support the needs of competitive markets for power generation Primarily because of ambiguities introduced as a result of recent restricting the of the industry and cost pressures from consumers and regulators investment to strengthen and upgrade the grid has lagged with the result that many parts of the bulk high voltage system are heavily stressed Electric systems are not designed to withstand or quickly recover from damage inflicted simultaneously on multiple components Such an attack could be carried out by knowledgeable attackers with little risk of detection or interdiction Further well planned and coordinated attacks by terrorists could leave the electric power system in a large region of the country at least partially disabled for a very long time Although there are many examples of terrorist and military attacks on power systems elsewhere in the world at the time of this study international terrorists have shown limited interest in attacking the U S power grid However that should not be a basis for complacency Because all parts of the economy as well as human health and welfare depend on electricity the results could be devastating Terrorism and the Electric Power Delivery System focuses on measures that could make the power delivery system less vulnerable to attacks restore power faster after an attack and make critical services less vulnerable while the delivery of conventional electric power has been disrupted
