Improving Flood Prediction Assimilating Uncertain Crowdsourced Data into

Hydrologic and Hydraulic Models Maurizio Mazzoleni,2017-03-16 In recent years the continued technological advances have led to the spread of low cost sensors and devices supporting crowdsourcing as a way to obtain observations of hydrological variables in a more distributed way than the classic static physical sensors The main advantage of using these type of sensors is that they can be used not only by technicians but also by regular citizens However due to their relatively low reliability and varying accuracy in time and space crowdsourced observations have not been widely integrated in hydrological and or hydraulic models for flood forecasting applications Instead they have generally been used to validate model results against observations in post event analyses This research aims to investigate the benefits of assimilating the crowdsourced observations coming from a distributed network of heterogeneous physical and social static and dynamic sensors within hydrological and hydraulic models in order to improve flood forecasting The results of this study demonstrate that crowdsourced observations can significantly improve flood prediction if properly integrated in hydrological and hydraulic models This study provides technological support to citizen observatories of water in which citizens not only can play an active role in information capturing evaluation and communication leading to improved model forecasts and better flood management
