Abstract

Wheelchair upper limb exoskeletons can present a revolutionary approach to aid individuals with neuromuscular disorders in their daily tasks, which require two primary factors, i.e., estimating the human intention to decrease human–robot interactions and generating the adaptive optimal control signals. Therefore, firstly, this study aimed to propose an adaptive neuro-fuzzy sliding mode controller to generate the optimal control signals, in which and an adaptive optimal multi-critic-based neuro-fuzzy system was designed to tune the control gains of the sliding mode controller according to the changes in the joint torques and tracking errors. Secondly, a neural network model was designed as a measurement function in the structure of an extended Kalman filter to infer the human's continuous movement intention, which was trained to establish a comprehensive relationship between inputs, i.e., joints' kinematics and pushrim force, and outputs, i.e., electromyography features. Data acquisition relied on Biometrics Ltd.'s DataLink software and hardware, including surface electromyography and electrogoniometer sensors, while a force sensor system was designed for pushrim force acquisition. The features were extracted using the nonnegative matrix factorization method. The results of the proposed controller were compared with two of the newest control strategies for position-tracking in the wheelchair upper limb exoskeleton robotic system, i.e., proportional derivative-based fuzzy sliding mode control and a fuzzy-based nonsingular terminal sliding mode control structures, which both used the sliding mode control approach with different proposed sliding surfaces to generate the required control signals and also used the neuro-fuzzy system to improve the performance. For the proposed measurement model, the results were compared with the linear regression model and the adaptive neuro-fuzzy inference system, which are two of the most used classification methods. The results affirmed the efficacy of the proposed controller as a robust and accurate control structure for trajectory tracking, both in the absence and presence of disturbance, thereby underscoring its potential for practical applications in manual wheelchair propulsion. Furthermore, the findings underscored the proposed measurement model's robustness and adaptability, making it a promising tool for estimating continuous joint movements in rehabilitation and assistive applications.

1 Introduction

Manual wheelchairs (MWs) are crucial assistive devices for over 90% of the 65 million manual wheelchair users (MWUs) worldwide [1]. However, the repetitive movements in manual wheelchair propulsion (MWP) can impose excessive loads on the upper limb muscles, reducing efficiency and causing musculoskeletal pain [2, 3]. Therefore, MWUs are always prone to upper limb pathology and clinical rehabilitation.

can give rise to various problems the analysts may encounter like numerical difficulties instability strange forms of behavior e g chaotic etc This volume is concerned with some modern tools and techniques which can be useful for the modeling of dynamics We focus our attention on two important areas which play a key role nowadays namely automation and robotics and biological systems We also add some new applications which can greatly benefit from the availability of effective and efficient tools for modeling dynamics exemplified by some applications in security systems

Soft Computing and Fractal Theory for Intelligent Manufacturing Oscar Castillo,Patricia Melin,2012-08-11 We describe in this book new methods for intelligent manufacturing using soft computing techniques and fractal theory Soft Computing SC consists of several computing paradigms including fuzzy logic neural networks and genetic algorithms which can be used to produce powerful hybrid intelligent systems Fractal theory provides us with the mathematical tools to understand the geometrical complexity of natural objects and can be used for identification and modeling purposes Combining SC techniques with fractal theory we can take advantage of the intelligence provided by the computer methods and also take advantage of the descriptive power of the fractal mathematical tools Industrial manufacturing systems can be considered as non linear dynamical systems and as a consequence can have highly complex dynamic behaviors For this reason the need for computational intelligence in these manufacturing systems has now been well recognized We consider in this book the concept of intelligent manufacturing as the application of soft computing techniques and fractal theory for achieving the

goals of manufacturing which are production planning and control monitoring and diagnosis of faults and automated quality control As a prelude we provide a brief overview of the existing methodologies in Soft Computing We then describe our own approach in dealing with the problems in achieving intelligent manufacturing Our particular point of view is that to really achieve intelligent manufacturing in real world applications we need to use SC techniques and fractal theory
