Question 21(a)

Criteria	Marks
- Gives an appropriate judgement of the reliability of the results (low) - Provides a suitable reason for their judgement, e.g. reference to number of photos (repetition) or range of results (replication)	2
- Gives an appropriate judgement of the reliability of the results (low) - OR - Includes some relevant information on reliability (e.g. identifies a feature of reliability; repetition or replication)	1

Sample answer:

The reliability of the results obtained would be considered low. Although the students repeated the procedure five times using the same conditions, or as similar as possible (drone, day, time), there was a large variation in the number of kangaroos counted in each photograph from the different locations, possibly due to a clumped distribution. Many more repetitions of the same quadrats would be needed to develop a reliable population estimate for this type of animal.

Question 21(b)

Criteria	Marks
- Gives an appropriate judgement of the claim's validity - Provides suitable reason/s for this judgement - Includes a correct calculation	3
- Response includes TWO of the following: - Gives an appropriate judgement of the claim's validity - Provides suitable reason/s for this judgement - Includes a relevant calculation step, e.g. kangaroos per km² OR gives correct population estimate but no working	2
ONE of the above	1

Sample answer:

Using the students' results, the average number of kangaroos can be calculated as follows:

$$\frac{(6 + 13 + 2 + 8 + 5)}{5} = 6.8 \text{ kangaroos per km}^2$$
 Given that the size of the Murrumbidgee National Park is 22 km², the students' estimate for kangaroo population is: 6.8 per km² × 22 km² = 149.5 ≈ 150 kangaroos. The advertising claim could be invalid since their estimate is higher than the value calculated using these results. More replication would be required.
