Design and Implementation of a Database Programming Language for XML-based Applications Henrike Schuhart, 2006 This publication focuses on two main aspects the seamless integration of XML and persistency concepts into the object oriented programming language Java XML is the de facto standard data exchange format between arbitrary applications There have been many efforts to integrate XML into programming languages reaching from the simple document object model DOM to whole XML class generators These approaches are available in most popular programming languages The integration of persistency into programming languages has been done by database programming languages as well as by certain new popular frameworks like Hibernate or approaches like EJB Nevertheless these approaches suffer from certain limitations concerning in particular transparency and object orientation While existing database programming languages integrate the relational model Hibernate and EJB 3 x does not support polymorphism in general EJB 2 x does not even support inheritance In addition although they try to the approaches except by some database programming languages are not transparent In this work transparency means that arbitrary types may become persistent Moreover algorithms remain unchanged whether they are executed on transient or persistent objects Finally users can work with persistency on a very high level Since there are so many currently developed frameworks trying to solve the integration problem of XML and persistency into object oriented programming languages the need for a holistic and transparent object oriented database programming language seems to be there The starting point of XOBEDBPL which stands for XML OBJects Database Programming Language is the predecessor project XOB XOB concentrates on the integration of XML objects and XPath as the query language for these objects The most important feature of XOB is that each XML operation is statically type checked against the declared XML schema In XOBEDBPL the XML integration is extended regarding the manipulation of XML objects Before XML objects could only be queried but not updated The static type checking idea is kept and enhanced to include updates While XOB s intentions lie on the development of web applications all objects can remain transient XOBEDBPL is supposed to deal with persistent objects as well

Datenversorgung komponentenbasierter Informationssysteme Jürgen Sellentin, 2013-03-07 Das vorliegende Buch klassifiziert verschiedene Technologien der Datenversorgung und bewertet sie in Bezug auf ihre Praxistauglichkeit Dabei geht es nicht einfach um eine weitere Kopplung zu Datenbanksystemen sondern um den allgemeinen Zugriff auf beliebige Datenquellen Anwendungssysteme wie SAP Internet Sites usw Der Zugriff auf diese ist häufig nur über proprietäre und stark eingeschränkte Schnittstellen möglich die keinesfalls die Mächtigkeit von SQL erreichen

Neben dieser eher technischen Zugriffsfrage geht es vor allem auch um das Format und die Modellierung von Daten und damit um ihre gewöhnliche Interpretation und Bedeutung. Den Schwerpunkt bilden dafür Konzepte und Techniken auf Basis des Produktdatenstandards STEP ISO 10303 und dessen Anbindung an Java sowie des Middleware Standards CORBA deren Stärken und Schwächen gezielt diskutiert werden. Real-Time & Stream Data Management Wolfram Wingerath, Norbert Ritter, Felix Gessert, 2019-01-02 While traditional databases excel at complex queries over historical data, they are inherently pull based and therefore ill equipped to push new information to clients. Systems for data stream management and processing on the other hand are natively push oriented and thus facilitate reactive behavior. However, they do not retain data indefinitely and are therefore not able to answer historical queries. The book provides an overview over the different push based mechanisms for data retrieval in each system class and the semantic differences between them. It also provides a comprehensive overview over the current state of the art in real time databases. It first includes an in depth system survey of today's real time databases: Firebase, Meteor, RethinkDB, Parse, Baqend and others. Second, the high level classification scheme illustrated above provides a gentle introduction into the system space of data management. Abstracting from the extreme system diversity in this field, it helps readers build a mental model of the available options. Foundations of Intelligent Systems Ning Zhong, Zbigniew W. Ras, Shusaku
