Advances in Low-Level Color Image Processing M. Emre Celebi, Bogdan Smolka, 2013-12-17 Color perception plays an important role in object recognition and scene understanding both for humans and intelligent vision systems Recent advances in digital color imaging and computer hardware technology have led to an explosion in the use of color images in a variety of applications including medical imaging content based image retrieval biometrics watermarking digital inpainting remote sensing visual quality inspection among many others As a result automated processing and analysis of color images has become an active area of research to which the large number of publications of the past two decades bears witness The multivariate nature of color image data presents new challenges for researchers and practitioners as the numerous methods developed for single channel images are often not directly applicable to multichannel ones The goal of this volume is to summarize the state of the art in the early stages of the color image processing pipeline

Proceedings of ... International Conference on Information, Communications, and Signal Processing ,2003 *Review of Bayer Pattern Color Filter Array (CFA) Demosaicing with New Quality Assessment Algorithms* ,2010 To address the frequent lack of a reference image or ground truth when performance testing Bayer pattern color filter array CFA demosaicing algorithms we propose two new no reference quality assessment algorithms These new algorithms give a relative comparison of two demosaicing algorithms by measuring the presence of two common artifacts in their output images For this purpose we reviewed various demosaicing algorithms especially adaptive color plane gradient based methods and median filtering paying particular attention to the false color and edge blurring artifacts common to all demosaicing algorithms We also reviewed classic quality assessment methods that require a reference image MSE PSNR and deltaE characterized their typical usage and identified their associated pitfalls With this information in mind the motivations for no reference quality assessment are discussed From that we designed new quality assessment algorithms to compare two images demosaiced from the same CFA data by measuring the sharpness of the edges and determining the presence of false colors Using these new algorithms we evaluated and ranked the previously described demosaicing algorithms We reviewed a large quantity of real images which were used to justify the rankings suggested by the new quality assessment algorithms This work provides a path forward for future research investigating possible relationships between CFA demosaicing and color image super resolution
