Geospatial Technologies in Environmental Management Nancy Hoalst-Pullen, Mark W. Patterson, 2010-09-27 Geotechnologies and the Environment Environmental Applications and Management presents an engaging and diverse array of physically oriented GIScience applications that have been organized using four broad themes While the book's themes are by no means mutually exclusive Hoalst Pullen and Patterson provide an elegant overview of the field that frames the collection's subsequent thematic structure Wilderness and Wildlife Response Glaciers Wetlands and Watersheds and Human Health and the Environment Over the course of the volume the contributing authors move beyond basic and in some respects clichéd landscape ecology of land use change to explore human environment dynamics heretofore not emphasized in the applied literature In doing so the collection presents a compelling case for the importance of developing new physically oriented GIScience applications that reside at the nexus of social and natural systems with the explicit intent of informing public policy and or the decision making practices of resource managers Individually the chapters themselves are intentionally diverse The diversity of the approaches their spatial context and emphases on management applications demonstrate the many ways in which geotechnologies can be used to address small and big problems in both developed and developing regions The collection's internal coherence is derived like the book series from its explicit appeal to a wide variety of human environment interactions with potential policy linkages

Environmental Modeling Michael F. Goodchild, Louis T. Steyaert, Bradley O. Parks, Carol Johnston, David Maidment, Michael Crane, Sandi Glendinning, 1996-09-30. **GIS and Environmental Modeling: Progress and Research Issues** Michael F. Goodchild, Louis T. Steyaert, Bradley O. Parks, Carol Johnston, David Maidment, Michael Crane, and Sandi Glendinning, Editors. With growing pressure on natural resources and landscapes, there is an increasing need to predict the consequences of any changes to the environment. Modelling plays an important role in this by helping our understanding of the environment and by forecasting likely impacts. In recent years, moves have been made to link models to Geographical Information Systems to provide a means of analysing changes over an area as well as over time. **GIS and Environmental Modeling** explores the progress made to date in integrating these two software systems. Approaches to the subject are made from theoretical, technical, as well as data standpoints. The existing capabilities of current systems are described along with important issues of data availability, accuracy, and error. Various case studies illustrate this and highlight the common concepts and issues that exist between researchers in different environmental fields. The future needs and prospects for integrating GIS and environmental models are also explored, with developments in both data handling and modelling discussed. The book brings

together the knowledge and experience of over 100 researchers from academic commercial and government backgrounds who work in a wide range of disciplines The themes followed in the text provide a fund of knowledge and guidance for those involved in environmental modelling and GIS The book is easily accessible for readers with a basic GIS knowledge and the ideas and results of the research are clearly illustrated with both colour and black and white graphics

Quantifying Diets of Wildlife and Fish Michael C. Calver, Neil R. Loneragan, 2024-05 Quantifying Diets of Wildlife and Fish presents different techniques available to study animal diets Ecologists determine animal diets to build natural history knowledge test hypotheses in ecological theory and make informed management decisions for important ecosystems Many researchers use techniques traditionally applied to the animals they study rather than techniques with the greatest potential for the aims of each project In an effort to encourage researchers to consider new approaches this book focuses on the techniques rather than on particular groups of organisms or specific environments With contributions from leading ecologists chapters explore experimental design observational techniques including new technologies stomach contents and faecal analysis eDNA tracers and stable isotopes They also cover the latest multivariate methods of analyses suitable for describing animal diets and feeding relationships as well as

testing hypotheses relevant to ecological theory environmental management and biological conservation The expert knowledge provided will encourage readers to look beyond the boundaries of their specialties assist in testing important hypotheses and provide insights into management problems The examples in this book cover a range of vertebrates and invertebrates as well as different environments to open these methods up for novice ecologists and stimulate lateral thinking in more experienced researchers
