State of Innovation Fred L. Block, Matthew R. Keller, 2015-11-17 The worst economic crisis since the Great Depression has generated a fundamental re-evaluation of the free market policies that have dominated American politics for three decades *State of Innovation* brings together critical essays looking at the innovation industry in the context of the current crisis The book shows how government programs and policies have underpinned technological innovation in the US economy over the last four decades despite the strength of free market political rhetoric The contributors provide new insights into where innovations come from and how governments can support a dynamic innovation economy as the US recovers from a profound economic crisis *State of Innovation* outlines a 21st century policy paradigm that will foster cutting edge innovation which remains accountable to the public

Networks on Chip Axel Jantsch, Hannu Tenhunen, 2007-05-08 As the number of processor cores and IP blocks integrated on a single chip is steadily growing a systematic approach to design the communication infrastructure becomes necessary Different variants of packed switched on chip networks have been proposed by several groups during the past two years This book summarizes the state of the art of these efforts and discusses the major issues from the physical integration to architecture to operating systems and application interfaces It also provides a guideline and vision about the direction this field is moving to Moreover the book outlines the consequences of adopting design platforms based on packet switched network The consequences may in fact be far reaching because many of the topics of distributed systems distributed real time systems fault tolerant systems parallel

Multicore Systems On-Chip: Practical Software/Hardware Design Abderazek Ben Abdallah, 2013-07-20 System on chips designs have evolved from fairly simple uncore single memory designs to complex heterogeneous multicore SoC architectures consisting of a large number of IP blocks on the same silicon To meet high computational demands posed by latest consumer electronic devices most current systems are based on such paradigm which represents a real revolution in many aspects in computing The attraction of multicore processing for power reduction is compelling By splitting a set of tasks among multiple processor cores the operating frequency necessary for each core can be reduced allowing to reduce the voltage on each core Because dynamic power is proportional to the frequency and to the square of the voltage we get a big gain even though we may have more cores running As more and more cores are integrated into these designs to share the ever increasing processing load the main challenges lie in efficient memory hierarchy scalable system interconnect new programming paradigms and efficient integration methodology for connecting such heterogeneous cores into a single system capable of leveraging their individual flexibility Current design methods tend toward mixed HW SW co designs targeting multicore systems on chip for specific applications To decide on the lowest cost mix of cores designers must iteratively map the device s functionality to a particular HW SW partition and target architectures In addition to connect the heterogeneous cores the architecture requires high performance complex communication architectures and efficient communication protocols such as hierarchical bus point to point connection or Network on Chip Software development also becomes far more complex due to the difficulties in breaking a single processing task into multiple parts that can be processed separately and then reassembled later This reflects the fact that certain processor jobs cannot be easily parallelized to run concurrently on multiple processing cores and that load balancing between processing cores especially heterogeneous cores is very difficult
