Accurate diagnosis, prognosis, and subsequent rehabilitation care planning for persons with Disorders of Consciousness (DoC) has historically posed a challenge for neurological care professionals. Evidence suggests rates of misdiagnosis may be as high as 40% when informal bedside evaluations are used to determine level of consciousness. The presence of myriad medical, neurological, functional (motor, sensory, cognitive) and environmental confounds germane to these conditions complicates behavioral assessment. Achieving diagnostic certainty is elusive but critical to inform care planning, clinical decision making, and prognostication. Standardized neurobehavioral rating scales has been shown to improve accuracy in distinguishing between coma, unresponsive wakefulness syndrome/vegetative state and minimally consciousness state as compared to informal assessment methods. Thus, these scales are currently recommended for use as the informal “gold standard” for diagnostic assessment in DoC. The following paper will present an evidence-based approach to neurobehavioral assessment for use in clinical practice. Strategies for optimizing assessment and aiding in identification and management of confounds that can limit diagnostic accuracy will be provided. Finally, clinical application of an interdisciplinary approach to identifying and managing confounds will be discussed and how assessment results can be used to identify trends in performance and guide prognostic counseling with families.

Introduction

Impairments in arousal and awareness after severe brain injury are ubiquitous to disorders of consciousness (DoC) which include coma, unresponsive wakefulness syndrome (UWS)/vegetative state (VS), and the minimally conscious state (MCS). MCS is a clinically heterogeneous category; as it is further stratified into MCS plus (+) and MCS minus (–).

Handbook of Neuropsychological Assessment Antonio E. Puente,Robert J. McCaffrey,2013-11-11 The growth of clinical neuropsychology has been unprecedented This growth has been oriented more toward the provision of than toward the foundation for services Thus while a greater number of psychologists are performing a greater number of neuropsychological procedures there seems to us an uneven parallel growth between these services and the empirical foundations for them It should come to no one s surprise that increasingly aggressive attacks on the field have been leveled Despite these attacks clinical neuropsychology continues to enjoy exceptional growth within psychology and acceptance by other health practitioners insurance companies legislators judges juries and above all consumers of our services Growth without self reflection is a dangerous enterprise as is growth without directions We find it disconcerting that existing and limited self analysis has assumed that neuropsychological dysfunction is immune to the same variables that affect psychological dysfunction Some attention has been paid to the most obvious ones such as age but all others have been ignored and or misunderstood This neglect has spawned a body of knowledge replete with questionable data and unfounded conclusions Hence it is surprising that clinical neuropsychologists consider themselves to be more scientifically sound than their regular clinical counterparts Diagnostic Clinical Neuropsychology Erin D. Closed Head Injury: A Clinical Source Book 3rd Edition, Mild to moderate to severe closed head injuries result from accidents that force the soft tissue of the brain into contact with the hard bony skull. Long-term effects and poor prognosis turn these injuries into major, often life-long problems. Until recently, physicians did not or could not diagnose many of them, and lawyers found them too difficult to prove. *Closed Head Injury: A Clinical Source Book* helps the practitioner understand how emerging diagnoses of previously ignored brain trauma can be a new source of compensation to injured parties. The author, a noted expert on the subject, clearly explains the nature of the injury, how to identify it, and the information you need to prove it. *Closed Head Injury: A Clinical Source Book* leads the trial attorney into new territories for litigation with up-to-date analysis and instruction on successful trial strategies. Written by leading neurologist Peter Bernad and his team, this volume provides a detailed and practical guide for litigating closed head injury cases. *Closed Head Injury: A Clinical Source Book* covers the medical and neuropsychological analysis of closed head injury, including its causes and effects, evaluation of damages, treatments, and trial techniques. The Fourth Edition contains important new and updated materials on topics related to closed head injuries, such as Medical Diagnosis and Treatment, Psychological Treatment, Treatment of Pain, Forensic Evidence, Insurance Analysis, ANS Monitoring, and Goals of Therapy.
