Neurofibromatoses Dieter Kaufmann, 2008 The neurofibromatoses are autosomal dominant genetic disorders of the nervous system that primarily affect the development and growth of neural cell tissue These disorders cause tumors to grow on nerves and produce other abnormalities such as skin changes and bone deformities In recent years the genes and mutations causing neurofibromatoses have been identified The main types of neurofibromatoses type 1 NF1 and type 2 NF2 have been shown to be distinctive disorders both clinically and genetically More recently allelic and non allelic subtypes of NF1 have been defined as well as the NF2 related condition schwannomatosis Many of the complex molecular mechanisms leading to the neurofibromatoses have been elucidated resulting in a growing body of publications which are difficult to keep up with This volume provides an important overview of recent findings on the neurofibromatoses It focuses on the genetics and molecular biology underlying these diseases but also covers their clinical features diagnosis and treatment stressing the need for interdisciplinary medical care With contributions by the foremost investigators in the field this timely book will appeal to geneticists genetic counselors pediatricians neurologists and oncologists

Multidisciplinary Approach to Neurofibromatosis Type 1 Gianluca Tadini, Eric Legius, Hilde Brems, 2020-06-02 This volume offers an update of the clinical signs diagnostic criteria including molecular diagnosis and targeted therapies for a particular type of genodermatosis providing a handy and unique tool for early diagnosis In recent years our understanding of genodermatosis and neurocutaneous syndromes has increased but although Type 1 Neurofibromatosis NF1 is the most common neuroectodermal disorder and involves a large number of patients and medical disciplines this syndrome remains underestimated often misdiagnosed thus leading to inaccurate treatment The literature on the molecular and pathogenetic aspects is ample but current clinical approaches classification diagnostic criteria and treatment protocols are outdated creating difficulties in early diagnosis and treatment As such a chapter is devoted renewing

current diagnostic criteria it includes clinical and molecular data to offer a sound updated discussion basis for a consensus conference NF1 is a time dependent disorder meaning that the onset of clinical signs are closely linked to patient age and the book discusses this particularly neglected aspect extensively as well as the latest molecular diagnosis techniques which are highly sensitive have not been included in the diagnostic criteria It also explains the role of the RAS MAPK pathway and genotype phenotype correlations In addition it explores new concepts concerning the pathogenesis of neurofibromas and other hamarthomas and their relevance for a modern therapeutical approach with targeted molecular drugs as well as newly discovered aspects of NF1 in all internal organs together with their diagnostic counterparts A chapter on mosaic neurofibromatosis is also included There is a particular focus on differential diagnosis i e other diseases with café au lait macules and the recently described Legius syndrome will be presented directly by Prof Eric Legius All chapters are easy to understand up to date comprehensive and concise tools and are intended for a wide range of professionals involved with genetic disorders of the skin and neurocutaneous diseases dermatologists pediatricians neurologists oncologists and general practitioners

The Molecular Biology of Neurofibromatosis Type 1 Meena Upadhyaya,2014-02-01 Neurofibromatosis type 1 NF1 is a common autosomal dominantly inherited tumour predisposition syndrome affecting 1 3 000 4 000 individuals worldwide This

inherited disorder results from the mutational inactivation of the NF1 gene on human chromosome 17 The NF1 gene contains 61 exons that give rise to 12kb mRNA encoding neurofibromin The 327kDa 2 818 amino acid neurofibromin protein is expressed in most tissues and has a number of alternative isoforms Neurofibromin is a tumour suppressor protein and down regulates cellular Ras Increased active Ras GTP levels also stimulate the important PI3K AKT mTOR signalling pathway that protects cells from apoptosis The major clinical features of NF1 include multiple café au lait macules skinfold freckles iris Lisch nodules and neurofibromas The diagnostic criteria for clinical diagnosis have been well established However there are a small number of cases in which the diagnosis is not certain The germline mutation rate for the NF1 gene is 10 fold higher than that observed for most other inherited diseases Using a combination of different techniques almost 95% of germline mutations can be detected To date only two firm genotype phenotype correlations have been reported NF1 phenotype exhibits large variations within a family evidence for modifying loci regulating the expression of an NF1 gene is beginning to emerge We also are gaining knowledge on the molecular mechanisms associated with the development of different types of tumours It is encouraging that the results of recent laboratory and clinical research are finally being translated into clinical trials With the availability of high throughput technologies sophisticated animal models and multi centre clinical trials the future for NF1 sufferers is looking optimistic This book aims to provide an overview of the genetic and clinical aspects of NF1 and its role in both NF1 associated and sporadic tumour development It emphasizes the recent developments in this field and some of the promising on going clinical trials
