

-NERVOUS SYSTEM-

ANATOMY AND PHYSIOLOGY NOTES

CELLS OF THE NERVOUS SYSTEM

→ Two types of cells that make up the nervous system are neurons and glial cells.

NEURONS

→ also called *nerve cells*.

→ receive stimuli, conduct action potentials, and transmit signals to other neurons or effector organs.

- **Cell body (Soma)** – contains a single nucleus: source of information for gene expression
- **Dendrites** – extensions of the cell body: receive information from other neurons; transmit the info toward the neuron cell body
- **Axon** – single long cell process: conduct action potentials from one part of the brain or spinal cord to another part.

- **Axon of sensory neurons** – conduct action potentials towards the CNS.
- **Axon of motor neurons** – conduct action potentials away from the CNS.

- **Axon hillock** – where the axon leaves the neuron cell body
- **Nissl bodies** – rough ER found in the cell body of a neuron
- **Schwann cells** – form a myelin sheath (increases speed of impulse transmission)
- **Collateral axons** – branches of axons

TYPES OF NEURONS

1. **Multipolar neurons** – many dendrites - a single axon
2. **Bipolar neurons** – two processes: 1 dendrite - 1 axon
3. **Pseudo-unipolar neurons** – single process that divides into 2 processes: extends to the periphery - extends to the CNS.

FIG. 1 Multipolar neuron (many dendrites and one axon)

FIG. 2 Bipolar neuron (one dendrite and one axon)

FIG. 3 Pseudo-unipolar neuron (single process that divides into two branches)

GLIAL CELLS

→ **neuroglia**

→ non-neuronal cells of the CNS - PNS

→ more numerous than neurons.

→ can divide to produce more cells.

- **Astrocytes** – major supporting cells in the CNS: stimulate/inhibit the signaling activity of nearby neurons; help limit damage to neural tissue

- **Blood brain barrier** – protects neurons from toxic substances in the blood; allows exchange of waste products - nutrients
