Network Coding Khaldoun Al Agha, 2012-12-27 Network coding a relatively new area of research has evolved from the theoretical level to become a tool used to optimize the performance of communication networks wired cellular ad hoc etc The idea consists of mixing packets of data together when routing them from source to destination Since network coding increases the network performance it becomes a tool to enhance the existing protocols and algorithms in a network or for applications such as peer to peer and TCP This book delivers an understanding of network coding and provides a set of studies showing the improvements in security capacity and performance of fixed and mobile networks This is increasingly topical as industry is increasingly becoming more reliant upon and applying network coding in multiple applications Many cases where network coding is used in routing physical layer security flooding error correction optimization and relaying are given all of which are key areas of interest Network Coding is the ideal resource for university students studying coding and researchers and practitioners in sectors of all industries where digital communication and its application needs to be correctly understood and implemented

Nikolletseas,José D.P. Rolim,2011-01-15 Wireless ad hoc sensor networks has recently become a very active research subject Achieving efficient fault tolerant realizations of very large highly dynamic complex unconventional networks is a real challenge for abstract modelling algorithmic design and analysis but a solid foundational and theoretical background seems to be lacking This book presents high quality contributions by leading experts worldwide on the key algorithmic and complexity theoretic aspects of wireless sensor networks The intended audience includes researchers and graduate students working on sensor networks and the broader areas of wireless networking and distributed computing as well as practitioners in the relevant application areas The book can also serve as a text for advanced courses and seminars *Three-Dimensional Model Analysis and Processing* Faxin Yu,Zheming Lu,Hao Luo,Pinghui Wang,2011-02-03 With the increasing popularization of the Internet together with the rapid development of 3D scanning technologies and modeling tools 3D model databases have become more and more common in fields such as biology chemistry archaeology and geography People can distribute

their own 3D works over the Internet search and download 3D model data and also carry out electronic trade over the Internet. However, some serious issues are related to this as follows:

- 1 How to efficiently transmit and store huge 3D model data with limited bandwidth and storage capacity
- 2 How to prevent 3D works from being pirated and tampered with
- 3 How to search for the desired 3D models in huge multimedia databases

This book is devoted to partially solving the above issues. Compression is useful because it helps reduce the consumption of expensive resources such as hard disk space and transmission bandwidth. On the downside, compressed data must be decompressed to be used, and this extra processing may be detrimental to some applications. 3D polygonal mesh with geometry, color, normal vector, and texture coordinate information as a common surface representation is now heavily used in various multimedia applications such as computer games, animations, and simulation applications. To maintain a convincing level of realism, many applications require highly detailed mesh models. However, such complex models demand broad network bandwidth and much storage capacity to transmit and store. To address these problems, 3D mesh compression is essential for reducing the size of 3D model representation.

Automata, Languages and Programming Luca Aceto, Ivan Damgaard, Leslie Ann Goldberg, Magnus M. Halldorsson, Anna Ingolfsson, Igor Walukiewicz, 2008-07-06. The 126 revised full papers presented together with 4 invited lectures were carefully reviewed and selected from a total of 407 submissions. The papers are grouped in three major tracks: algorithms, automata, complexity, and games; on logic, semantics, and theory of programming; and on security and cryptography foundations. LNCS 5125 contains 70 contributions of track A selected from 269 submissions as well as 2 invited lectures. The papers are organized in topical sections on: complexity, boolean functions and circuits, data structures, random walks and random structures, design and analysis of algorithms, scheduling, codes and coding, coloring, randomness in computation, online and dynamic algorithms, approximation algorithms, property testing, parameterized algorithms, and complexity, graph algorithms, computational complexity, games and automata, group testing, streaming, and quantum, algorithmic game theory, and quantum computing.
