An Assessment of the Science Proposed for the Deep Underground Science and Engineering Laboratory (DUSEL) National Research Council, Division on Engineering and Physical Sciences, Board on Physics and Astronomy, Ad Hoc Committee to Assess the Science Proposed for a Deep Underground Science and Engineering Laboratory (DUSEL), 2012-02-02 According to the big bang theory our Universe began in a state of unimaginably high energy and density contained in a space of subatomic dimensions At that time unlike today the fundamental forces of nature were presumably unified and the particles present were interacting at energies not attainable by present day accelerators Underground laboratories provide the conditions to investigate processes involving rare phenomena in matter and to detect the weak effects of highly elusive particles by replicating similar environments to those once harnessed during the earliest states of the Earth These laboratories now appear to be the gateway to understanding the physics of the grand unification of the forces of nature Built to shield extremely sensitive detectors from the noise of their surroundings and the signals associated with cosmic rays underground facilities have been established during the last 30 years at a number of sites worldwide To date the United States efforts to develop such facilities have been modest and consist primarily of small underground laboratories However the U S underground community has pushed for larger underground facilities on the scale of major laboratories in other countries An Assessment of the Deep Underground Science and Engineering Laboratory DUSEL addresses this matter by evaluating the major physics questions and experiments that could be explored with the proposed DUSEL Measuring the potential impact this assessment also examines the broader effects of the DUSEL in regards to education and public outreach and evaluates the need associated with developing U S programs similar to science programs in other regions of the world

Newsletter ,1998 Science And Technology In Deep Underground Laboratories Aldo Ianni,Sean M. Paling,Carlos Peña Garay,Jeter Hall,2024-12-31 Deep Underground Laboratories are multidisciplinary research infrastructures with a rock overburden that goes from a few hundred meters to a few kilometers Presently there are 13 laboratories in operation on three Continents North America Europe Asia Australia for a global excavation volume of order 10 6 m³ New laboratories are being constructed proposed including a new one in South America The main reason to develop an underground infrastructure is related to operate in a less radioactive environment where in particular muons from cosmic rays are strongly suppressed This low background environment opens the possibility to search for very rare events such as low energy neutrino interactions dark matter direct detection and neutrinoless double beta decay These are crucial studies to enhance our understanding of the Universe In addition these special environments in which these infrastructures are located provide opportunities to carry out many and varied studies on geology geophysics biology and planetary exploration of significant interest and impact in both pure and applied science A number of technological challenges over the last decades have been faced by scientists working in these infrastructures As a consequence state of the art facilities are in operation in Underground Laboratories for radio purity assay ultra low temperature detectors quantum computing radon suppression and mitigation advanced machining and next generation gravitational wave detectors **Energy and Water, and Related Agencies Appropriations for Fiscal Year ...** United States.
